### Effect of Intravascular Ultrasound-Guided vs. Angiography-Guided Everolimus-Eluting Stent Implantation: the IVUS-XPL Randomized Clinical Trial

# Myeong-Ki Hong, MD. PhD on behalf of the IVUS-XPL trial investigators

Severance Cardiovascular Hospital and Cardiovascular Research Institute, Yonsei University College of Medicine, Seoul, Korea

# Background

Clinical usefulness of IVUS

**IVUS usage during PCI** 

**Improved clinical outcomes** 

 There are no adequately powered randomized clinical trials to prove the clinical usefulness of IVUS for second-generation DESs.

#### Hypothesis

 The clinical outcomes of IVUS-guided secondgeneration DES implantation would be superior to those of angiography-guided DES implantation in a subset of patients with long coronary lesions.

# Study Design

- A prospective, randomized, multi-center trial
- At 20 centers in Korea
- Enrollment period: Oct 2010 and July 2014
- Key inclusion criteria
  - Age 20 years or older
  - Patients with typical chest pain or evidence of myocardial ischemia
  - Non-emergent conditions
  - Stent length ≥ 28 mm based on angiographic estimation
  - Significant coronary artery stenosis (>50% based on visual estimate) considered for coronary revascularization with stent implantation

- Key exclusion criteria
  - Acute ST-segment elevation or MI within 48 hours
  - Age >80 years
  - Cardiogenic shock
  - Left ventricular ejection fraction <40%</li>
  - Left main disease requiring PCI
  - Bifurcation lesion with 2-stent technique
  - Chronic total occlusion
  - Presence of previously implanted DES within 6 months
  - In-stent restenosis lesion

# Study Design

Patients with long coronary lesions (Implanted stent ≥28 mm in length) N = 1400

DES implantation with IVUS guidance n = 700

DES implantation with angiography guidance n = 700

# Clinical follow-up at 12 months Primary end point: MACE

Cardiac death, target-lesion related MI, and ischemia-driven TLR

Trial Registration: clinicaltrial.gov Identifier: NCT01308281

## **Statistical Analysis**

#### Sample size calculation

- Assumption the overall incidence of MACE to be <u>7% at the</u>
   <u>1-year in the angiography-guidance arm.</u>
- Superiority comparison with <u>an expected risk reduction of 50% in the IVUS-guidance arm</u> (α=0.05, β=0.8, drop-out=5-10%)
- → Each 700 patients in the IVUS guidance arm and in the angiography guidance arm.

Turco MA, et al. *JACC Cardiovasc Interv.* 2008;1:699-709 Kim YH, et al. *Circulation.* 2006;114:2148-2153

#### Primary analysis

- Intention-to-treat analysis with cumulative incidences of MACE at 1 year using the Kaplan-Meier estimates.
- Comparison using the log-rank test.

### **Procedure**

- Criteria for stent optimization
  - ✓ IVUS-guidance arm
    - Minimal lumen CSA > lumen CSA at distal reference segments
  - ✓ Angiography-guidance arm
    - Angiographic residual diameter stenosis
       <30% and the absence of angiographically detected dissection</li>

# Study Flow

13372 Patients underwent coronary angiography during the study inclusion period

11972 Excluded

1400 Randomized

700 Randomized to undergo IVUS-guidance PCI

- 678 Underwent IVUS-guidance PCI as randomized
  - 22 Underwent angiography-guidance PCI
    - 5 Technical failure to deliver IVUS catheter
    - **17** Physician decision due to unfavorable coronary anatomy
    - 4 Withdrew consent
  - 36 Lost to follow-up

700 Included in primary analysis

700 Randomized to undergo angiography-guidance PCI

- **670** Underwent angiography-guidance PCI as randomized
- 30 Underwent IVUS-guidance PCI
  - **22** Physician preference in complex lesions
    - **8** Angiographically ambiguous anatomy
  - 3 Withdrew consent
- 34 Lost to follow-up

700 Included in primary analysis

#### **Baseline Characteristics**

Characteristics	IVUS-guidance	Angiography-guidance	P value
No. of patients	700	700	
Age, y	64 (9)	64 (9)	.54
Male sex	483 (69)	481 (69)	.91

Minimal lumen area, mm <sup>2</sup>	6.09 ± 1.91	5.71 ± 1.71	.008
Distal reference EEM area, mm <sup>2</sup>	9.44 ± 3.98	10.94 ± 3.83	<.001
Distal reference lumen area, mm <sup>2</sup>	5.55 ± 1.82	6.83 ± 1.68	<.001

## **Primary End Point**

### **Conclusions**

- Among patients requiring long coronary stent implantation, the use of IVUS-guidance for DES implantation was associated with a significant 2.9% absolute reduction and 48% relative reduction in the risk of MACE at 1 year, compared with angiography-guidance.
- Our findings suggest better clinical outcomes of MACE with IVUS-guidance compared to angiography-guidance for DES implantation, particularly for diffuse long lesions.

#### Original Investigation

#### Effect of Intravascular Ultrasound–Guided vs Angiography-Guided Everolimus-Eluting Stent Implantation The IVUS-XPL Randomized Clinical Trial

Sung Jin Hong, MD: Byeong-Keuk Kim, MD: Dong-Ho Shin, MD, MPH: Chung-Mo Nam, PhD: Jung-Sun Kim, MD: Young-Guk Ko, MD; Dongboon Chol, MD: Tue-Soo Kang, MD, Woong-Chol Kang, MD; Ae-Young Her, MD; Yonghoon Kim, MD; Seung-Ho Hur, MD; Bum-Kie-Hong, MD; Hyuckmoon Kivon, MD; Yangsioo Jang, MD; Myeong-Kil Hong, MD; PhD; For the PUS-XVII; hwestigators

IMPORTANCE: Use of intravescular ultrasound (IVUS) promotes better clinical outcomes for coronary intervention in complex coronary lesions. However, randomized data demonstrating the clinical usefulness of PUS are limited for lesions treated with drug-eluting stents.

OBJECTIVE. To determine whether the long-term clinical outcomes with NUS-guided doug-elucing stent implantation are superior to those with angiography-guided implantation in patients with long coronary lesions.

DESIGN. SETTING, AND PARTICIPARTS. The Impact of Intravascular Ultrasound Guidance on Outcomes of Xience Prime Stents in Long Lesions (IVUS-XPL) randomized, multicenter trial was conducted in 1400 patients with long coronary lesions (implanted stent ≈28 mm in length) between October 2010 and July 2014 at 20 centers in Korea.

INTERVENTIONS Patients were randomly assigned to receive IVUS-guided (n = 700) or angiography-guided (n = 700) everolimus-eluting stent implantation.

MAIN OUTCOMES AND MEASURES Primary outcome measure was the composite of major adverse cardiac events, including cardiac death, target lesion-related myocardial infarction, or ischemia-driven target lesion revascularization at I year, analyzed by intention-to-treat.

RESULTS One-year follow-up was complete in 1323 patients (94.5%). Major adverse cardiac events at 1 year occurred in 19 patients (2.9%) undergoing [VUS-guided and in 39 patients (5.8%) undergoing angiography-guided stent implantation (absolute difference, ~2.97% [95% CI, ~5.14% to ~0.79%) (hazard ratio [HR], 0.48 [95% CI, 0.28 to 0.83], P ~ 0.077. The difference was driven by a lower risk of ischemia-driven target lesion revascularization in patients undergoing IVUS-guided (17 [2.5%]) compared with angiography-guided (33 [5.0%]) stent implantation (HR, 0.51 [95% CI, 0.28 to 0.91], P = .02). Cardiac death and target lesion-related myocardial infarction were not significantly different between the 2 groups. For cardiac death, there were 3 patients (0.4%) in the IVUS-guided group and 5 patients (0.7%) in the angiography-guided group (HR, 0.60 [95% CI, 0.34 to 2.52], P = .48). Target lesion-related myocardial infarction occurred in 1 patient (0.1%) in the angiography-guided sestent implantation group (P = .32).

CONCLUSIONS AND RELEVANCE Among patients requiring long coronary stent implantation, the use of IVUS-guided everolimus-eluting stent implantation, compared with angiography-guided stent implantation, resulted in a significantly lower rate of the composite of
