**Anderson giving  
valve talk at  
Core Curriculum**

**AMERICAN  
COLLEGE of  
CARDIOLOGY**

# How much valve disease is out there?

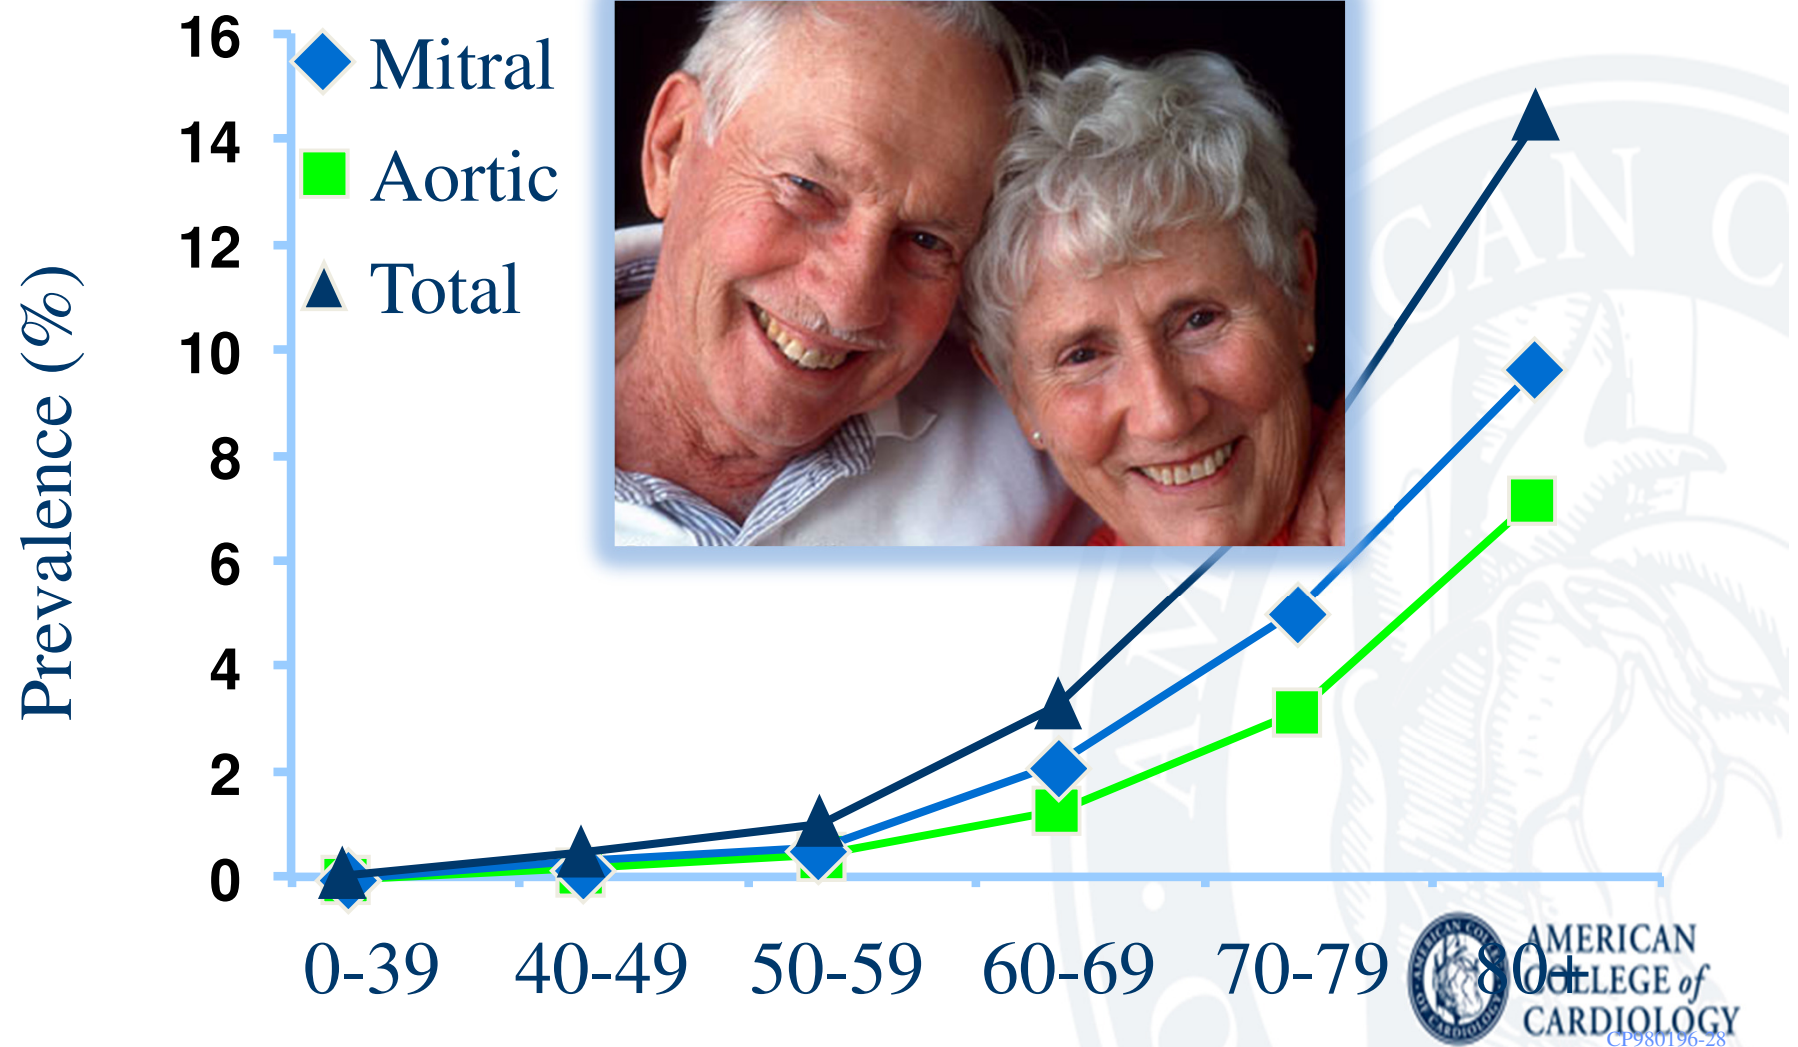

Valve Disease prevalence 2.5%  
0.7% 18-44y to 13.3%  $\geq 75$ y

Nkomo et al. Lancet 2006;368:1005

AMERICAN  
COLLEGE of  
CARDIOLOGY

# Prevalence of Valve Disease – Olmstead County

# Valve Disease in the Elderly

## Historically speaking!

- Two schools of thought:
  - Symptomatic elderly with VHD:
    - “You are too old and frail to undergo surgery!”
  - Asymptomatic elderly with severe VHD:
    - “You are doing too well to consider the risk of surgery!”

# 1998

AMERICAN  
COLLEGE of  
CARDIOLOGY

# What is new in the 2014 guidelines?

- Stages of disease
- Earlier therapy for asymptomatic patients
- Patient specific therapy (no one size for all)
- Tools to increase the utility of the guidelines

2013 ACCF/AHA Guideline for the Management of Heart Failure: A Report of the  
American College of Cardiology Foundation/American Heart Association Task Force  
on Practice Guidelines

# 2014 ACC/AHA Valve Guidelines

## Stage A-D

- Additional definitions of severity
- Guidance on when to intervene
- How often to perform follow up exams

AMERICAN  
COLLEGE of  
CARDIOLOGY

# Stages of Progression of VHD

Stage	Definition	Description
A	At risk	Patients with risk factors for the development of VHD
B	Progressive	Patients with progressive VHD (mild-to-moderate severity and asymptomatic)
C	Asymptomatic severe	Asymptomatic patients who have reached the criteria for severe VHD C1: Asymptomatic patients with severe VHD in whom the left or right ventricle remains compensated C2: Asymptomatic patients who have severe VHD, with decompensation of the left or right ventricle
D	Symptomatic severe	Patients who have developed symptoms as a result of VHD

# 2014 ACC/AHA Valve Guidelines

## Stage A-D

- What is severe valve disease?
  - Severe when outcomes are poor
  - Severe when symptoms occur
  - When intervention prolongs survival

AMERICAN  
COLLEGE of  
CARDIOLOGY

# Survival with asymptomatic aortic stenosis

<b>Patients with AV-Vel from 4.0 to 5.0 m/s</b>				
Pts. at risk:	82	69	59	38
<b>Patients with AV-Vel from 5.0 to 5.5 m/s</b>				
Pts. at risk:	72	53	29	18
<b>Patients with AV-Vel <math>\geq 5.5</math> m/s</b>				
Pts. at risk:	44	20	11	5

## Does area matter as much?

### Patients with $AVA \geq 0.6 \text{ cm}^2$

Pts. at risk: 69    47    25    14    7    5    2

### Patients with $AVA < 0.6 \text{ cm}^2$

Pts. at risk: 47    26    15    9    2    1    0

# Aortic Stenosis: Stages of Disease

*J Am Coll Cardiol.* 2014;63(22):2438-2488

Stage	Definition	Valve Anatomy	Valve Hemodynamics	Hemodynamic Consequences	Symptoms
A	At risk of AS	•Bicuspid aortic valve (or other congenital valve anomaly)•Aortic valve sclerosis	•Aortic Vmax <2 m/s	•None	•None
B	Progressive AS	•Mild-to-moderate leaflet calcification of a bicuspid or trileaflet valve with some reduction in systolic motion or•Rheumatic valve changes with commissural fusion	•Mild AS:Aortic Vmax 2.0–2.9 m/s or mean $\Delta P$ <20 mm Hg•Moderate AS:Aortic Vmax 3.0–3.9 m/s or mean $\Delta P$ 20–39 mm Hg	•Early LV diastolic dysfunction may be present•Normal LVEF	•None
C: Asymptomatic severe AS					
C1	Asymptomatic severe AS	•Severe leaflet calcification or congenital stenosis with severely reduced leaflet opening	•Aortic Vmax $\geq$ 4 m/s or mean $\Delta P$ $\geq$ 40 mm Hg•AVA typically is $\leq$ 1.0 cm <sup>2</sup> (or AVAi $\leq$ 0.6 cm <sup>2</sup> /m <sup>2</sup> )•Very severe AS is an aortic Vmax $\geq$ 5 m/s or mean $\Delta P$ $\geq$ 60 mm Hg	•LV diastolic dysfunction•Mild LV hypertrophy•Normal LVEF	•None: Exercise testing is reasonable to confirm symptom status
C2	Asymptomatic severe AS with LV dysfunction	•Severe leaflet calcification or congenital stenosis with severely reduced leaflet opening	•Aortic Vmax $\geq$ 4 m/s or mean $\Delta P$ $\geq$ 40 mm Hg•AVA typically $\leq$ 1.0 cm <sup>2</sup> (or AVAi $\leq$ 0.6 cm <sup>2</sup> /m <sup>2</sup> )	•LVEF <50%	•None
D: Symptomatic severe AS					
D1	Symptomatic severe high-gradient AS	•Severe leaflet calcification or congenital stenosis with severely reduced leaflet opening	•Aortic Vmax $\geq$ 4 m/s or mean $\Delta P$ $\geq$ 40 mm Hg•AVA typically $\leq$ 1.0 cm <sup>2</sup> (or AVAi $\leq$ 0.6 cm <sup>2</sup> /m <sup>2</sup> ) but may be larger with mixed AS/AR	•LV diastolic dysfunction•LV hypertrophy•Pulmonary hypertension may be present	•Exertional dyspnea or decreased exercise tolerance•Exertional angina•Exertional syncope or presyncope
D2	Symptomatic severe low-flow/low-gradient AS with reduced LVEF	•Severe leaflet calcification with severely reduced leaflet motion	•AVA $\leq$ 1.0 cm <sup>2</sup> with resting aortic Vmax <4 m/s or mean $\Delta P$ <40 mm Hg•Dobutamine stress echocardiography shows AVA $\leq$ 1.0 cm <sup>2</sup> with Vmax $\geq$ 4 m/s at any flow rate	•LV diastolic dysfunction•LV hypertrophy•LVEF <50%	•HF•Angina•Syncope or presyncope
D3	Symptomatic severe low-gradient AS with normal LVEF or paradoxical low-flow severe AS	•Severe leaflet calcification with severely reduced leaflet motion	•AVA $\leq$ 1.0 cm <sup>2</sup> with aortic Vmax <4 m/s or mean $\Delta P$ <40 mm Hg•Indexed AVA $\leq$ 0.6 cm <sup>2</sup> /m <sup>2</sup> and•Stroke volume index <35 mL/m <sup>2</sup> •Measured when patient is normotensive (systolic BP <140 mm Hg)	•Increased LV relative wall thickness•Small LV chamber with low stroke volume•Restrictive diastolic filling•LVEF $\geq$ 50%	•HF•Angina•Syncope or presyncope

CARDIOLOGY

# 2014 ACC/AHA Valve Guidelines

## Aortic Stenosis

- Stage C: Severe disease (asymptomatic)
  - AV velocity  $> 4$  m/s
  - C1: EF  $> 50\%$
  - C2: EF  $< 50\%$
- Stage D: Severe disease (symptomatic)
  - D1: high gradient, normal EF
  - D2: low gradient, low EF
  - D3: low gradient, normal EF

AMERICAN  
COLLEGE of  
CARDIOLOGY

**Table 13** Stages of *Primary* MR*J Am Coll Cardiol.* 2014;63(22):2438-2488

Grade	Definition	Valve Anatomy	Valve Hemodynamics*	Hemodynamic Consequences	Symptoms
A	At risk of MR	•Mild mitral valve prolapse with normal coaptation•Mild valve thickening and leaflet restriction	•No MR jet or small central jet area <20% LA on Doppler•Small vena contracta <0.3 cm	•None	•None
B	Progressive MR	•Severe mitral valve prolapse with normal coaptation•Rheumatic valve changes with leaflet restriction and loss of central coaptation•Prior IE	•Central jet MR 20%–40% LA or late systolic eccentric jet MR•Vena contracta <0.7 cm•Regurgitant volume <60 mL•Regurgitant fraction <50%•ERO <0.40 cm <sup>2</sup> •Angiographic grade 1–2+	•Mild LA enlargement•No LV enlargement•Normal pulmonary pressure	•None
C	Asymptomatic severe MR	•Severe mitral valve prolapse with loss of coaptation or flail leaflet•Rheumatic valve changes with leaflet restriction and loss of central coaptation•Prior IE•Thickening of leaflets with radiation heart disease	•Central jet MR >40% LA or holosystolic eccentric jet MR•Vena contracta ≥0.7 cm•Regurgitant volume ≥60 mL•Regurgitant fraction ≥50%•ERO ≥0.40 cm <sup>2</sup> •Angiographic grade 3–4+	•Moderate or severe LA enlargement•LV enlargement•Pulmonary hypertension may be present at rest or with exercise•C1: LVEF >60% and LVESD <40 mm•C2: LVEF ≤60% and LVESD ≥40 mm	•None
D	Symptomatic severe MR	•Severe mitral valve prolapse with loss of coaptation or flail leaflet•Rheumatic valve changes with leaflet restriction and loss of central coaptation•Prior IE•Thickening of leaflets with radiation heart disease	•Central jet MR >40% LA or holosystolic eccentric jet MR•Vena contracta ≥0.7 cm•Regurgitant volume ≥60 mL•Regurgitant fraction ≥50%•ERO ≥0.40 cm <sup>2</sup> •Angiographic grade 3–4+	•Moderate or severe LA enlargement•LV enlargement•Pulmonary hypertension present	•Decreased exercise tolerance•Exertional dyspnea

# Indications for Aortic Valve Replacement in Patients With Aortic Stenosis

# Indications for Surgery for Mitral Regurgitation

AMERICAN  
COLLEGE of  
CARDIOLOGY

# Individualized treatment strategies and “shared decision making”

- Clinical picture
- Imaging parameters
- Frailty assessment
- Multidisciplinary approach
- Don't forget to ask the family and patient!

AMERICAN  
COLLEGE of  
CARDIOLOGY

# Heart Valve Centers of Excellence

- Heart Valve Team approach
- High level of expertise
- High patient volume
- Data registry participation
- Reporting own data with continuous improvement process

# The Heart Valve Team and Heart Valve Centers of Excellence

Recommendations	COR	LOE
Patients with severe VHD should be evaluated by a multidisciplinary Heart Valve Team when intervention is considered	I	C
Consultation with or referral to a Heart Valve Center of Excellence is reasonable when discussing treatment options for 1) asymptomatic patients with severe VHD, 2) patients who may benefit from valve repair versus valve replacement, or 3) patients with multiple comorbidities for whom valve intervention is considered	IIa	C

# Trends in Mitral Valve Surgery in the United States: Results From The Society of Thoracic Surgeons Adult Cardiac Database

Fig 3. Overall mitral valve repair rates, percent repaired (gray bars), for isolated primary mitral valve operations, for the years 2000 to 2007 ( $p < 0.0001$ ).

# Less-Invasive Mitral Valve Operations: Trends and Outcomes From The Society of Thoracic Surgeons Adult Cardiac Surgery Database

Fig 3. Distribution of less-invasive mitral valve operations among centers performing this operation. (IQR = interquartile range.)

## Risk Assessment Combining STS Risk Estimate, Frailty, Major Organ System Dysfunction, and Procedure-Specific Impediments

	<b>Low Risk (must meet ALL criteria in this column )</b>	<b>Intermediate Risk (any 1 criteria in this column)</b>	<b>High Risk (any 1 criteria in this column)</b>	<b>Prohibitive Risk (any 1 criteria in this column)</b>
STS PROM	<4% <b>AND</b>	4% to 8% <b>OR</b>	>8% <b>OR</b>	Predicted risk with surgery of death or major morbidity (all-cause) >50% at 1 y <b>OR</b>
Frailty	None <b>AND</b>	1 index (mild) <b>OR</b>	2 or more indices (moderate-to-severe) <b>OR</b>	
Major organ system compromise not to be improved postoperatively	None <b>AND</b>	1 organ system <b>OR</b>	No more than 2 organ systems <b>OR</b>	3 or more organ systems <b>OR</b>
Procedure-specific impediment	None	Possible procedure-specific impediment	Possible procedure-specific impediment	Severe procedure-specific impediment

# Frequency of Echocardiograms in Asymptomatic Patients With VHD and Normal Left Ventricular Function

Stage	Valve Lesion			
Stage	Aortic Stenosis	Aortic Regurgitation	Mitral Stenosis	Mitral Regurgitation
Progressive (stage B)	Every 3–5 y (mild severity $V_{\max}$ 2.0–2.9 m/s) Every 1–2 y (moderate severity $V_{\max}$ 3.0–3.9 m/s)	Every 3–5 y (mild severity) Every 1–2 y (moderate severity)	Every 3–5 y (MVA >1.5 cm <sup>2</sup> )	Every 3–5 y (mild severity) Every 1–2 y (moderate severity)
Severe (stage C)	Every 1 y ( $V_{\max}$ ≥4 m/s)	Every 1 y Dilating LV—more frequent	Every 1–2 y (MVA 1.0–1.5 cm <sup>2</sup> ) Every 1 y (MVA <1 cm <sup>2</sup> )	Every 6 months to 1 y Dilating LV—more frequent

# Prosthetic Valve: Diagnosis and Follow-Up

Recommendations	COR	LOE
An initial TTE study is recommended in patients after prosthetic valve implantation for evaluation of valve hemodynamics	I	B
Repeat TTE is recommended in patients with prosthetic heart valves if there is a change in clinical symptoms or signs suggesting valve dysfunction	I	C
TEE is recommended when clinical symptoms or signs suggest prosthetic valve dysfunction	I	C
Annual TTE is reasonable in patients with a bioprosthetic valve after the first 10 years, even in the absence of a change in clinical status	IIa	C

# 21<sup>st</sup> Century ACC/AHA Valve Guidelines

What cool tools can help facilitate the use of our guidelines?

AMERICAN  
COLLEGE of  
CARDIOLOGY

- 28 year old female student
  - mechanical St. Jude mitral valve 4 years ago
  - INR = 3.0
  - daily warfarin dose is 3 mg
  - now 8 weeks pregnant

AMERICAN  
COLLEGE of  
CARDIOLOGY

# Now what is a practitioner to do?

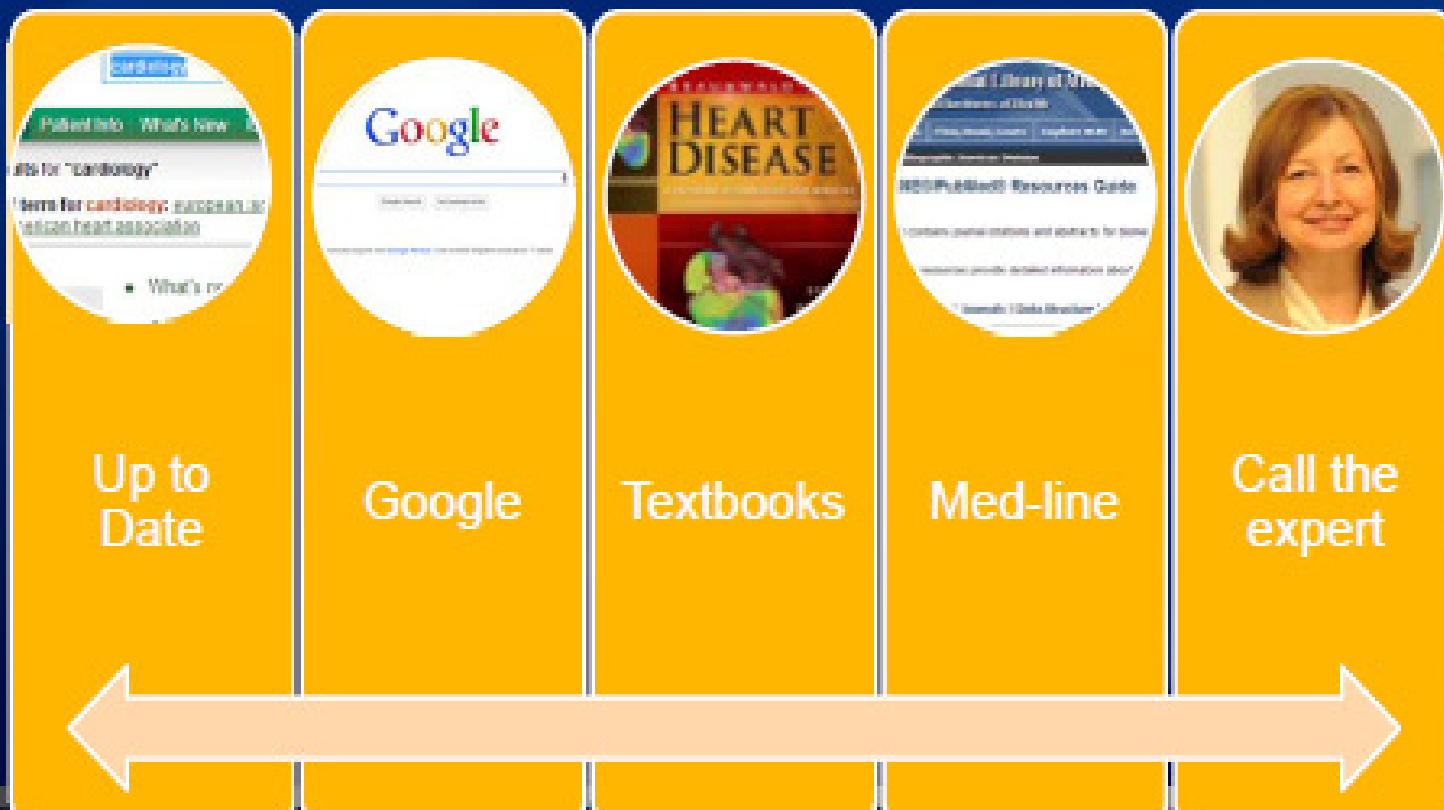

- Continue warfarin?
- Switch to low molecular weight heparin?
- Subcutaneous heparin?
- Not really sure?

AMERICAN  
COLLEGE of  
CARDIOLOGY

## Where do we go for knowledge? - quickly

AMERICAN  
COLLEGE of  
CARDIOLOGY

# Where would you look for an answer?

COLLEGE of  
CARDIOLOGY

Table 4. Frequency of Echocardiograms in Asymptomatic Patients With VHD and Normal Left Ventricular Function

Stage	Valve Lesion			
Stage	Aortic Stenosis*	Aortic Regurgitation	Mitral Stenosis	Mitral Regurgitation
Progressive (stage B)	Every 3–5 y (mild severity $V_{max}$ 2.0–2.9 m/s) Every 1–2 y (moderate severity $V_{max}$ 3.0–3.9 m/s)	Every 3–5 y (mild severity) Every 1–2 y (moderate severity)	Every 3–5 y (MVA >1.5 cm <sup>2</sup> )	Every 3–5 y (mild severity) Every 1–2 y (moderate severity)
Severe (stage C)	Every 6–12 mo ( $V_{max}$ >4 m/s)	Every 6–12 mo Dilating LV: more frequently	Every 1–2 y (MVA 1.0–1.5 cm <sup>2</sup> ) Once every year (MVA <1.0 cm <sup>2</sup> )	Every 6–12 mo Dilating LV: more frequently

Patients with mixed valve disease may require serial evaluations at intervals earlier than recommended for single valve lesions.

\*With normal stroke volume.

LV indicates left ventricle; MVA, mitral valve area; VHD, valvular heart disease; and  $V_{max}$ , maximum velocity.

Table 5. Risk Assessment Combining STS Risk Estimate, Frailty, Major Organ System Dysfunction, and Procedure-Specific Impediments

	Low Risk (Must Meet ALL Criteria in This Column)	Intermediate Risk (Any 1 Criterion in This Column)	High Risk (Any 1 Criterion in This Column)	Prohibitive Risk (Any 1 Criterion in This Column)
STS PROM*	<4% AND None	4%–8% OR 1 Index (mild)	>8% OR ≥2 Indices (moderate to severe)	Predicted risk with surgery of death or major morbidity (all-cause) >50% at 1 y OR ≥3 Organ systems
Frailty†	None	1 Organ system	No more than 2 organ systems	OR Severe procedure-specific impediment
Major organ system compromise not to be improved postoperatively‡	None	OR	OR	
Procedure-specific impediment§	None	Possible procedure-specific impediment	Possible procedure-specific impediment	

\*Use of the STS PROM to predict risk in a given institution with reasonable reliability is appropriate only if institutional outcomes are within 1 standard deviation of STS average observed/expected ratio for the procedure in question.

†Seven frailty indices: Katz Activities of Daily Living (independence in feeding, bathing, dressing, transferring, toileting, and urinary continence) and independence in ambulation (no walking aid or assist required or slower walk in <6 s). Other scoring systems can be applied to calculate no, mild, or moderate-to-severe frailty.

‡Examples of major organ system compromise: Cardiac—severe LV systolic or diastolic dysfunction or RV dysfunction, fixed pulmonary hypertension; CKD stage 3 or worse; pulmonary dysfunction with FEV1 <50% or DLCO<sub>2</sub> <50% of predicted; CNS dysfunction (dementia, Alzheimer's disease, Parkinson's disease, CVA with persistent physical limitation); GI dysfunction—Crohn's disease, ulcerative colitis, nutritional impairment, or serum albumin <3.0; cancer—active malignancy; and liver—any history of cirrhosis, variceal bleeding, or elevated INR in the absence of VHA therapy.

§Examples: tracheostomy present, heavily calcified ascending aorta, chest malformation, arterial coronary graft adherent to posterior chest wall, or radiation damage.

CHD indicates chronic kidney disease; CNS, central nervous system; CVA, stroke; DLCO<sub>2</sub>, diffusion capacity for carbon dioxide; FEV1, forced expiratory volume in 1 s; GI, gastrointestinal; INR, international normalized ratio; LV, left ventricular; PROM, predicted risk of mortality; RV, right ventricular; STS, Society of Thoracic Surgeons; and VHA, vitamin K antagonist.

#### CLASS IIa

1. Prophylaxis against infective endocarditis (IE) is reasonable for the following patients at highest risk for adverse outcomes from IE before dental procedures that involve manipulation of gingival tissue, manipulation of the periapical region of teeth, or perforation of the oral mucosa (41–43) (Level of Evidence: B):
  - Patients with prosthetic cardiac valves;
  - Patients with previous IE;
  - Cardiac transplant recipients with valve regurgitation due to a structurally abnormal valve; or
  - Patients with CHD with:
    - Unrepaired cyanotic CHD, including palliative shunts and conduits;
    - Completely repaired congenital heart defect repaired with prosthetic material or device, whether placed by surgery or catheter intervention, during the first 6 months after the procedure; or
    - Repaired CHD with residual defects at the site or adjacent to the site of a prosthetic patch or prosthetic device.

#### CLASS III: No Benefit

1. Prophylaxis against IE is not recommended in patients with VHD who are at risk of IE for nondental procedures (e.g., TEE, esophagogastroduodenoscopy, colonoscopy, or cystoscopy) in the absence of active infection (44). (Level of Evidence: B)

#### 2.5. Evaluation of Surgical and Interventional Risk

See Table 5 for risk assessment combining STS risk estimate, frailty, major organ system dysfunction, and procedure-specific impediments.

#### 2.6. The Heart Valve Team and Heart Valve Centers of Excellence: Recommendations

##### CLASS I

1. Patients with severe VHD should be evaluated by a multidisciplinary Heart Valve Team when intervention is considered. (Level of Evidence: C)

##### CLASS IIa

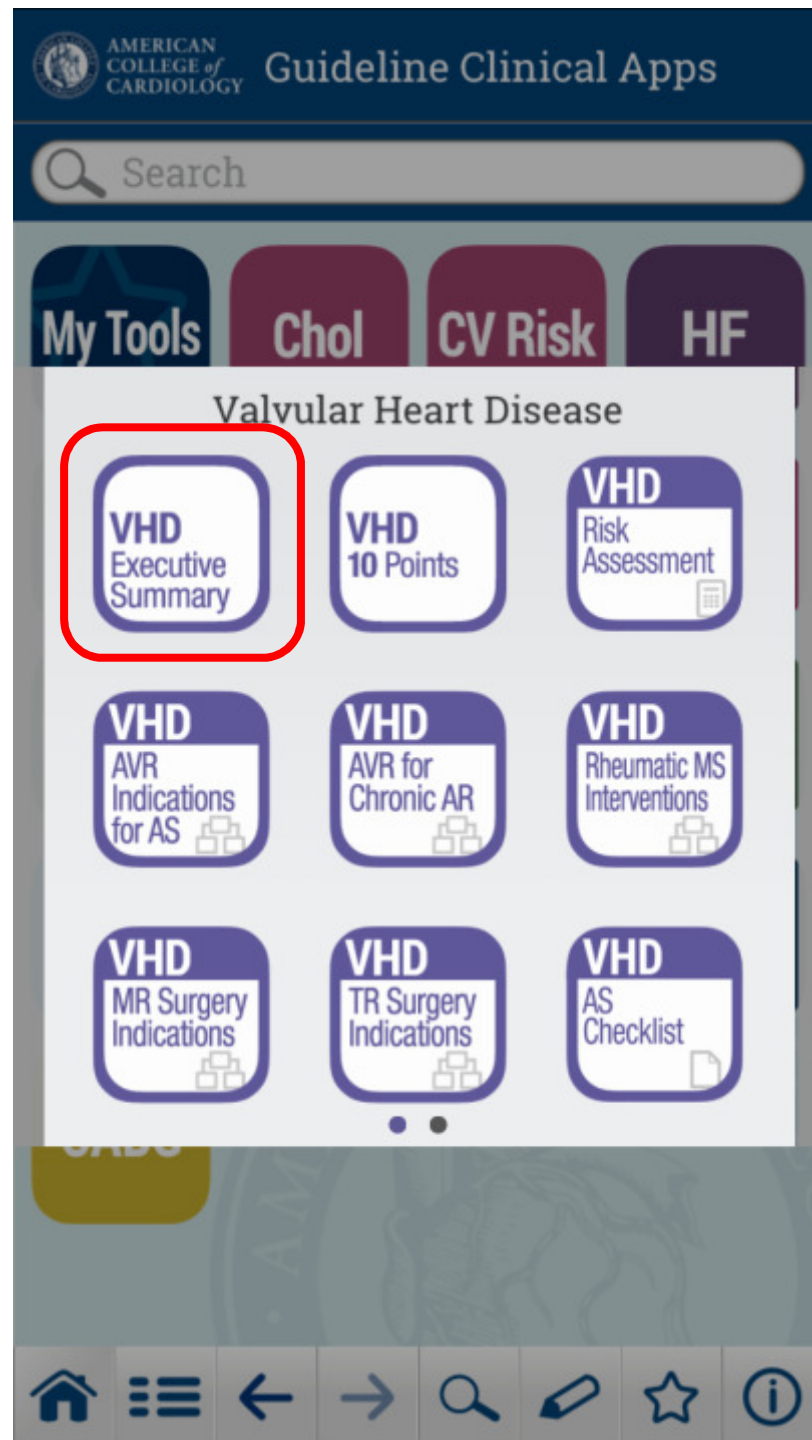

1. Consultation with or referral to a Heart Valve Center of Excellence is reasonable when discussing treatment options for 1) asymptomatic patients with severe VHD, 2) patients who may benefit from valve repair versus valve replacement, or 3) patients with multiple comorbidities for whom valve intervention is considered. (Level of Evidence: C)

A competent, practicing cardiologist should have the ability to diagnose and direct the treatment of most patients with VHD. For instance, otherwise healthy patients with

Adjusted TAVR In-Hospital Mortality Risk

[Click here for info about this risk model](#)

Patient's Risk

12.85%

National Average

4%as of May 2015

In the United States, the average mortality of all patients undergoing this procedure is **4%**. Taking into account the patient's specific clinical condition, the statistical estimate that she might not survive the procedure is **12.85%**. This means that for every 100 patients having a similar clinical makeup, there would be **12.85** who did not survive.

The model provides an objective risk-adjusted estimate of in-hospital mortality which has real value for both patient and provider. It should be considered as one element in the evaluation process, to be considered along with the

# Summary

- 2014 guidelines clarify stages of valve disease
- use recent data on natural history, outcomes, improved imaging, less invasive interventions
- endorse the “Heart Team” approach to care of valve disease patients
- emphasize individualized care
- facilitated the use of “point of care” tools

**"The doctor will be with you in a few minutes. He's trying to figure out what disease goes with your insurance."**
