**A Multicenter, Prospective, Randomized Trial
Comparing Intravascular Ultrasound-guided
versus Angiography-guided Implantation of
Drug-Eluting Stent in All-comers**

Background

- Both randomized and observational studies have reported the clinical advantages of IVUS guidance for patients who have complex lesions.
- The benefits of IVUS guidance over angiography guidance in all-comers who receive 2nd generation DES implantation still remain understudied.

ULTIMATE

Study Design

1448 all-comer patients

1:1 Randomization

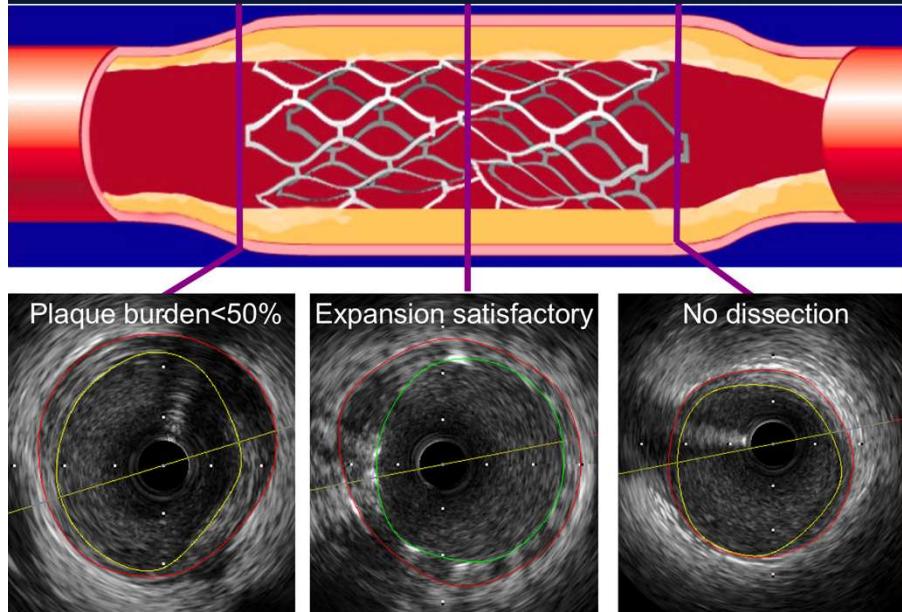

**IVUS guidance
(n=724)**

**Angiography guidance
(n=724)**

Primary endpoint: TVF at 12 months

ULTIMATE

IVUS-defined Criteria for The Optimal Stent Deployment

1. Minimal lumen CSA in stented segment $>5.0 \text{ mm}^2$, or 90% of distal reference lumen CSA;
2. Plaque burden at the 5-mm proximal or distal to the stent edge $<50\%$;
3. no edge dissection involving media with length $>3\text{mm}$.

ULTIMATE

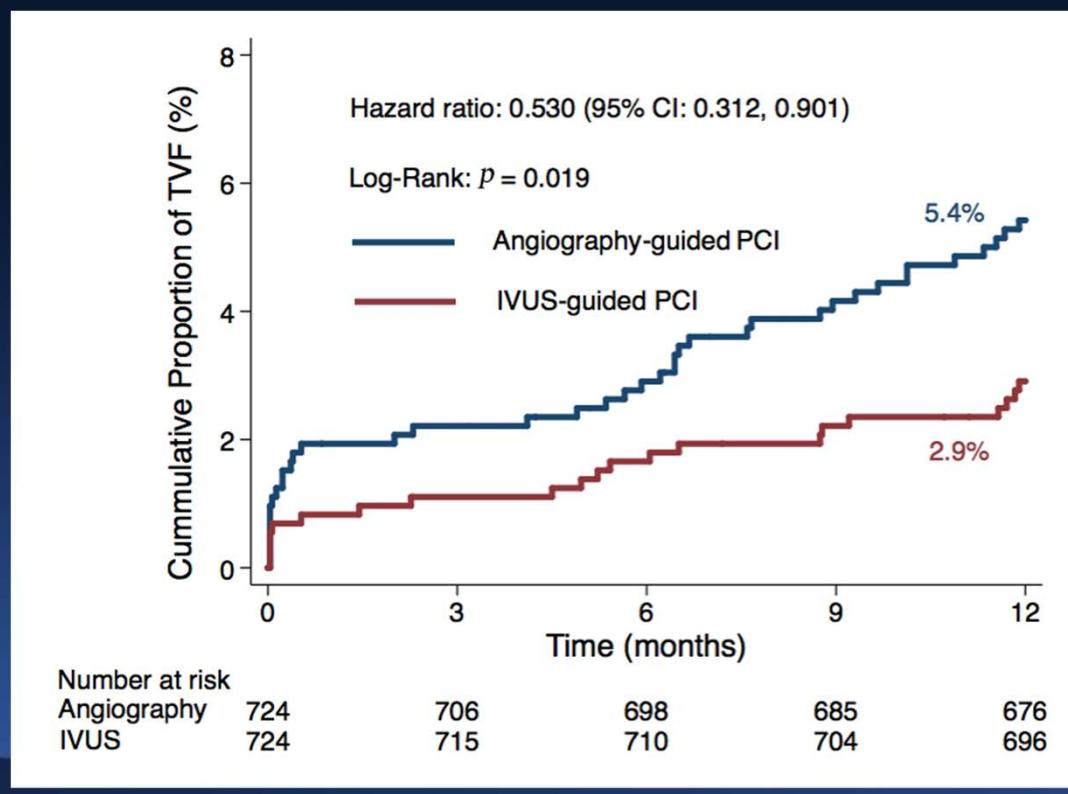

Clinical Outcomes

	IVUS guidance (n = 724)	Angiography guidance (n = 724)	P
Primary endpoint at 30-day			
TVF	0.8%	1.9%	0.08
Primary endpoint at 12-month			
TVF	2.9%	5.4%	0.019
Cardiac death	0.7%	1.4%	0.19
TVMI	1.0%	1.5%	0.34
Clinically-driven TVR	1.5%	2.9%	0.07
Safety endpoint at 12-month			
Definite/probable ST	0.1%	0.7%	0.10

ULTIMATE

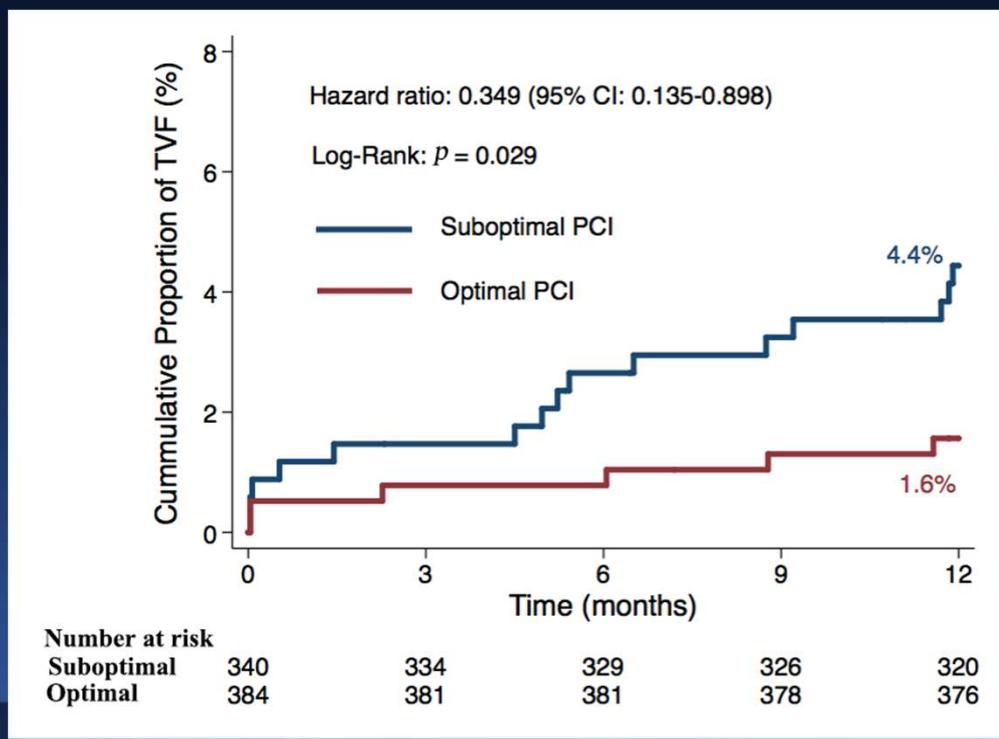

Primary Endpoint

TVF at 12 months

ULTIMATE

Optimal vs. Suboptimal IVUS-guided PCI TVF at 12 months

Conclusion

In the present multicenter randomized trial, IVUS-guided DES implantation in all-comers resulted in lower incidence of TVF at 12 months, compared with angiography guidance, particularly for patients who had an IVUS-defined optimal procedure.
