# Coronary Calcification Impacts PCI

Impairs device crossing

Delamination

Under expansion

Balloon:  
Insufficient force

Atheroablative technologies  
Atherectomy: Wire bias

Laser: Unpredictable

# Acoustic Pressure Waves Fracture Calcium

Acoustic pressure waves (1 pulse/sec) travel through tissue with an effective pressure of **~50 atm** and **fractures both superficial and deep calcium**

# Multi-plane and Longitudinal Calcium Fracture

Pre-procedure

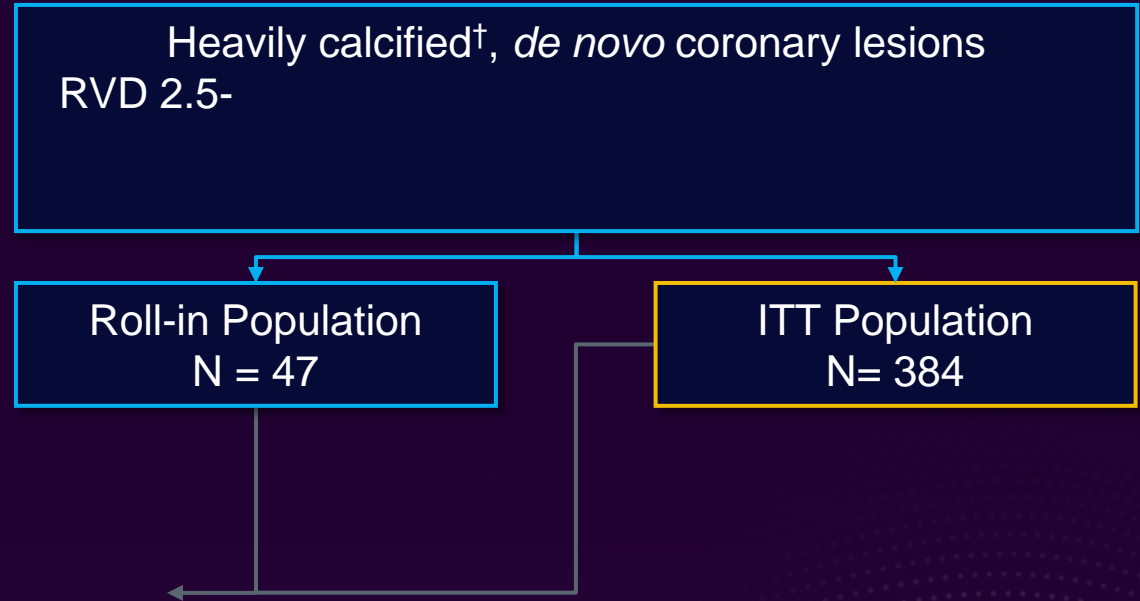

Post-IVL

Post-stent

# Disrupt CAD III: Study Design\*

# Major Endpoints

- **Primary safety endpoint:** Freedom from MACE at 30 days  
Cardiac death, or  
Myocardial infarction\*, or  
Target vessel revascularization
- **Primary effectiveness endpoint:** Procedural success  
Successful stent delivery with residual stenosis <50% and without in-hospital MACE
- **Secondary endpoints:**  
Device crossing success<sup>†</sup>  
Angiographic success<sup>‡</sup>  
  
-hospital MACE  
  
Sensitivity analysis for peri-procedural MI using the SCAI and 4<sup>th</sup> Universal Definitions<sup>§</sup>

\*CK-MB level >3x ULN through discharge (peri-procedural MI) and using the 4<sup>th</sup> Universal Definition of MI beyond discharge

<sup>†</sup>Delivery of IVL across the target lesion and delivery of lithotripsy without serious angiographic complications immediately after IVL

<sup>‡</sup>

# Key Clinical and Angiographic Eligibility Criteria

## Inclusion

- Biomarkers (troponin or CK-MB) normal within 12 hours prior to procedure
- LVEF >25% within 6 months of procedure
- Single *de novo*
  - ° by IVUS or OCT
- 
- 
- Lesion site severe calcification:
  - Angiographic radio-opacities prior to contrast involving both sides of arterial wall with total calcium
  - ° of calcium on at least one cross section by IVUS or OCT

## Exclusion

- Renal failure (serum creatinine >2.5 or chronic dialysis)
- Acute MI within 30 days prior to index procedure

# Statistical Methods

- Pre-specified performance goals (PG) were based on the rates from the predicate single-arm, non-randomized ORBIT II IDE study\*:
  - Enrolled similar patient population with similar endpoints and definitions
  - Relative risk of 1.5 was utilized
- **Primary safety performance goal: 84.4%**
  - Calculation:  $100\% - (1.5 * \text{observed 30-day MACE rate in ORBIT II of } 10.4\%)$
- **Primary effectiveness performance goal: 83.4%**
  - Calculation:  $100\% - (1.5 * \text{observed procedural failure rate in ORBIT II of } 11.1\%)$
- both co-primary PGs at a 1-sided type 1 error rate of 5%
  - Expected freedom from MACE at 30-days = 89.6% power
  - Expected procedural success rate = 88.9% power
  - N = 392 evaluable patients with expected rate of attrition = 5%

# IVL-induced Ventricular Capture\*

|  | No IVL-induced capture<br>(N=245) | IVL-induced capture<br>(N=171) | <i>P</i> value |
|--|-----------------------------------|--------------------------------|----------------|
| Pre-procedure heart rate, bpm  | 69.0 ± 11.9                       | 65.9 ± 11.4                    | 0.009          |
| Drop in systolic BP during procedure                                       | 24.5%                             | 40.5%                          | 0.0007         |
| Magnitude of systolic BP decrease, mmHg                                    | 23.5 ± 15.0                       | 18.9 ± 14.2                    | 0.07           |
| Sustained ventricular arrhythmia during or immediately after IVL procedure | 0.4%                              | 0.0%                           | 1.0            |

\*41% of patients with no sustained ventricular arrhythmias or clinical sequelae

# Conclusions

- Disrupt CAD III trial success was achieved as both primary safety and effectiveness endpoints were met following treatment with coronary IVL in severely calcified lesions
- Coronary IVL prior to DES implantation was well tolerated with a low rate of major peri-procedural clinical and angiographic complications
- Transient IVL-induced ventricular capture was common, but was benign with no clinical sequelae in any patient
- Although this study represents the initial coronary IVL experience for U.S. operators, high procedural success and low angiographic complications were achieved, reflecting the relative ease of use of IVL technology

the clinical research group!**

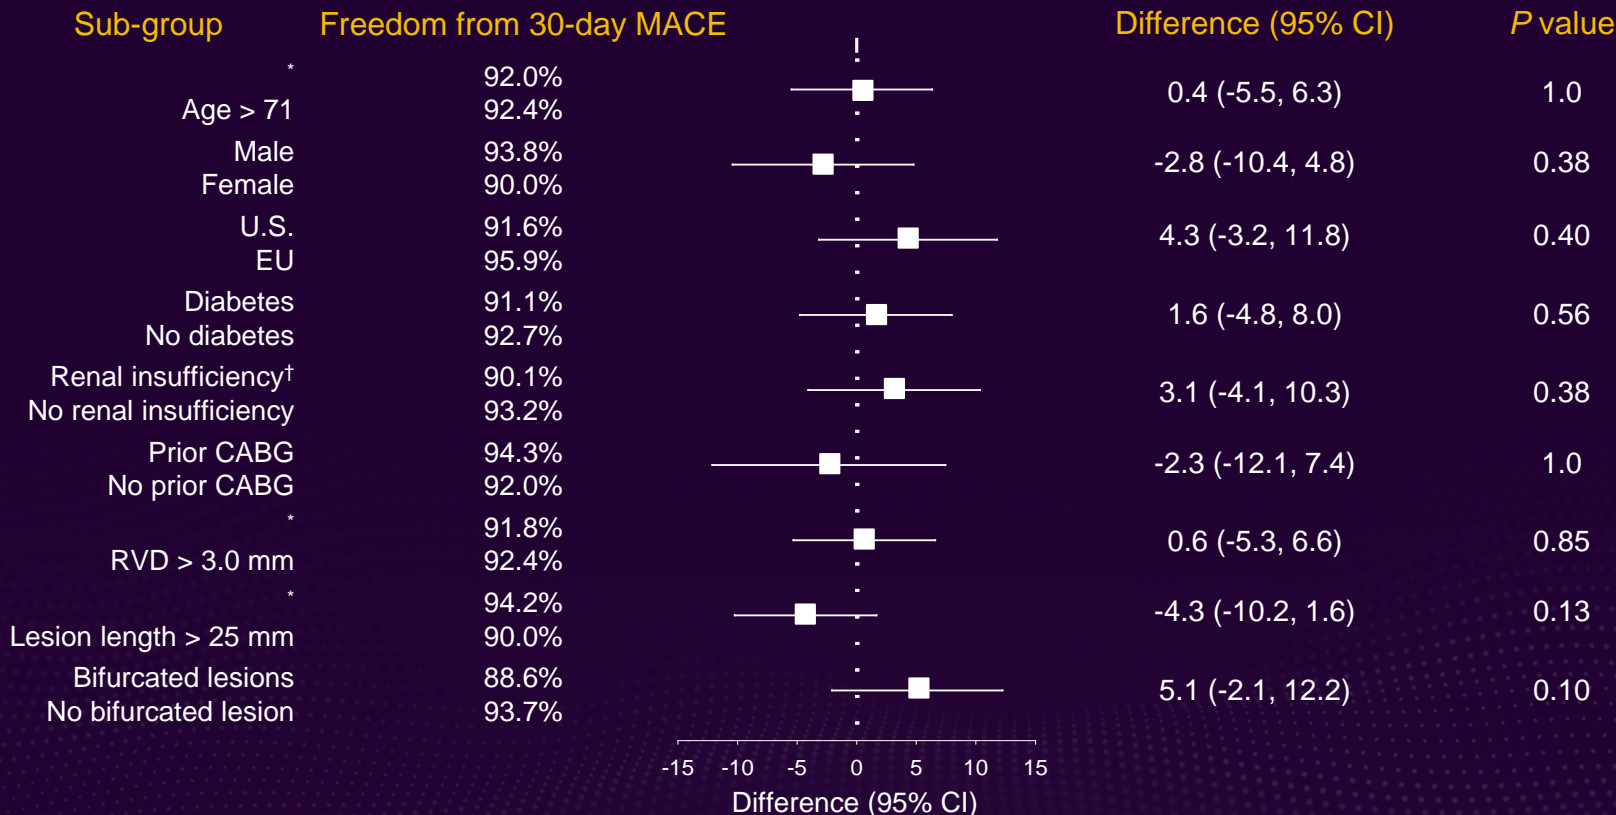

# Back-Up

# IVL Learning Curve

- Roll-in patients represent the first case for each site in the study
- Baseline clinical and angiographic characteristics were similar between the two groups
- Key study outcomes were similar between roll-in and pivotal patients

# Primary Safety by Sub-groups
