

One-Month DAPT

#AHA20

AMERICAN
COLLEGE of
CARDIOLOGY

Trial Description: Patients undergoing PCI for stable or unstable ischemic heart disease were randomized to 1-month of DAPT (n = 1,507) vs. 6-12 months of DAPT (n = 1,513)

RESULTS

- Primary outcome (cardiac death, nonfatal MI, target-vessel revascularization, stroke, or major bleeding at 12 months) occurred in 5.9% of the 1-month DAPT group compared with 6.5% of the 6- to 12-month DAPT group (p for noninferiority < 0.001; p for superiority = 0.48)
- Secondary outcomes of the 1-month DAPT group compared with the 6- to 12-month DAPT group:
 - All-cause death: 0.9% vs. 1.3%
 - Stent thrombosis: 0.7% vs. 0.8%
 - Major bleeding: 1.7% vs. 2.5%

CONCLUSIONS

- Among patients undergoing PCI for stable or unstable coronary artery disease, 1 month of DAPT was noninferior to 6-12 months of DAPT
