Within the past 12 months, I or my spouse/partner have had a financial interest/arrangement or affiliation with the organization(s) listed below

<u>Affiliation/Financial Relationship</u>	<u>Company</u>
Grant/Research Support (Institutional)	Ablative Solutions, Biotronik, Medtronic Orbus Neich, Teleflex
Consulting Fees/Honoraria	Medtronic, HyperQure
Major Stock Shareholder/Equity	BioStar Ventures (none related to ASI)
Royalty Income	None
Ownership/Founder	None
Intellectual Property Rights	None
Other Financial Benefit	None

TARGET BP I

Background

- Globally, over 1/3 of adults have hypertension, yet many remain uncontrolled, leading to increased risk of cardiovascular events

A 5-mmHg absolute reduction in office systolic blood pressure leads to a 10% reduction in major CV events¹

- New blood pressure guidelines motivated by increasing awareness of benefit with more intensive blood pressure control, unacceptable levels of hypertension control^{2,3}, and increasing recognition of non-adherence to antihypertensive medications identify the need for alternative treatment options
- Renal denervation (RDN) procedure targets the sympathetic nervous system to lower blood pressure
- Catheter-based perivascular delivery of dehydrated alcohol represents a novel method of neural ablation, achieving a confluent arc of ablation with single, targeted treatment within the renal artery
- To further explore outcomes with alcohol-mediated RDN in the presence of antihypertensive medications, an international sham-controlled RCT was performed

Alcohol-Mediated Renal Denervation

Perivascular Delivery of Alcohol to Adventitial Space

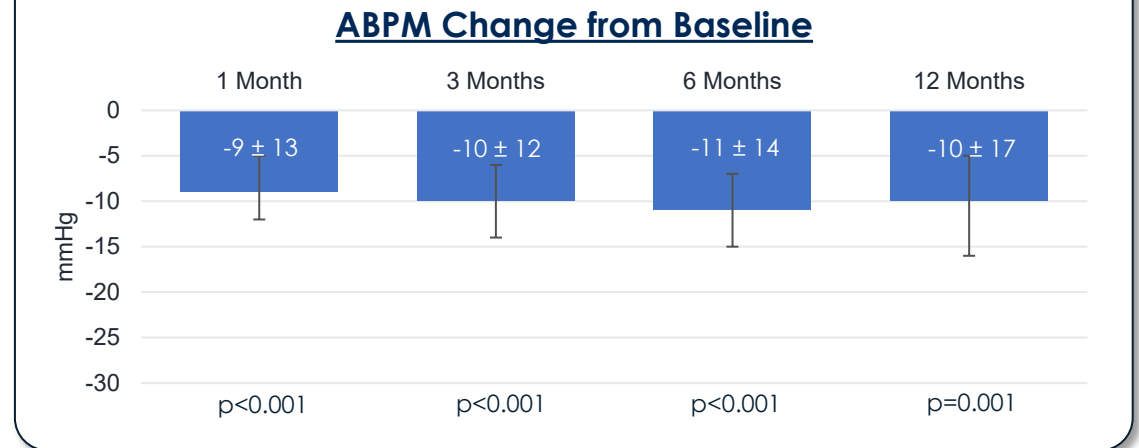

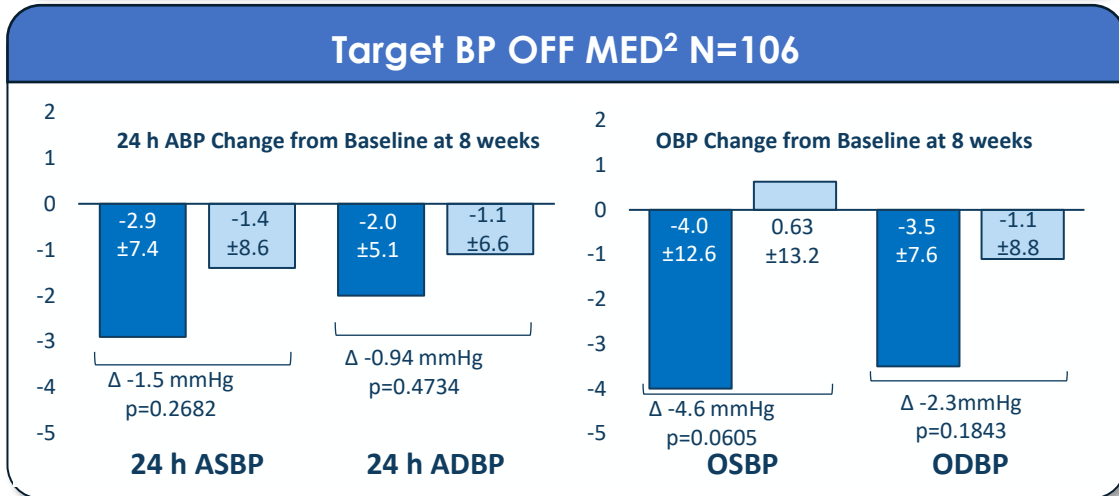

Expanded View of Device Infusing Alcohol

Site-specific delivery of alcohol: Local nerve inactivation, no collateral damage

1. Micro-volume (0.6 mL) infused directly to the perivascular region
2. Extracellular fluid helps spread alcohol circumferentially in the perivascular region
3. Alcohol activity range self-limited through dilution by extracellular fluid

Stable regimen of anti-HTN
medications

Addition of HTN medications (if required)
according to specific criteria and titration

INCLUSION CRITERIA

- Stable regimen of 2-5 anti-HTN meds including diuretic*
- Renal artery diameter between 3 and 7 mm

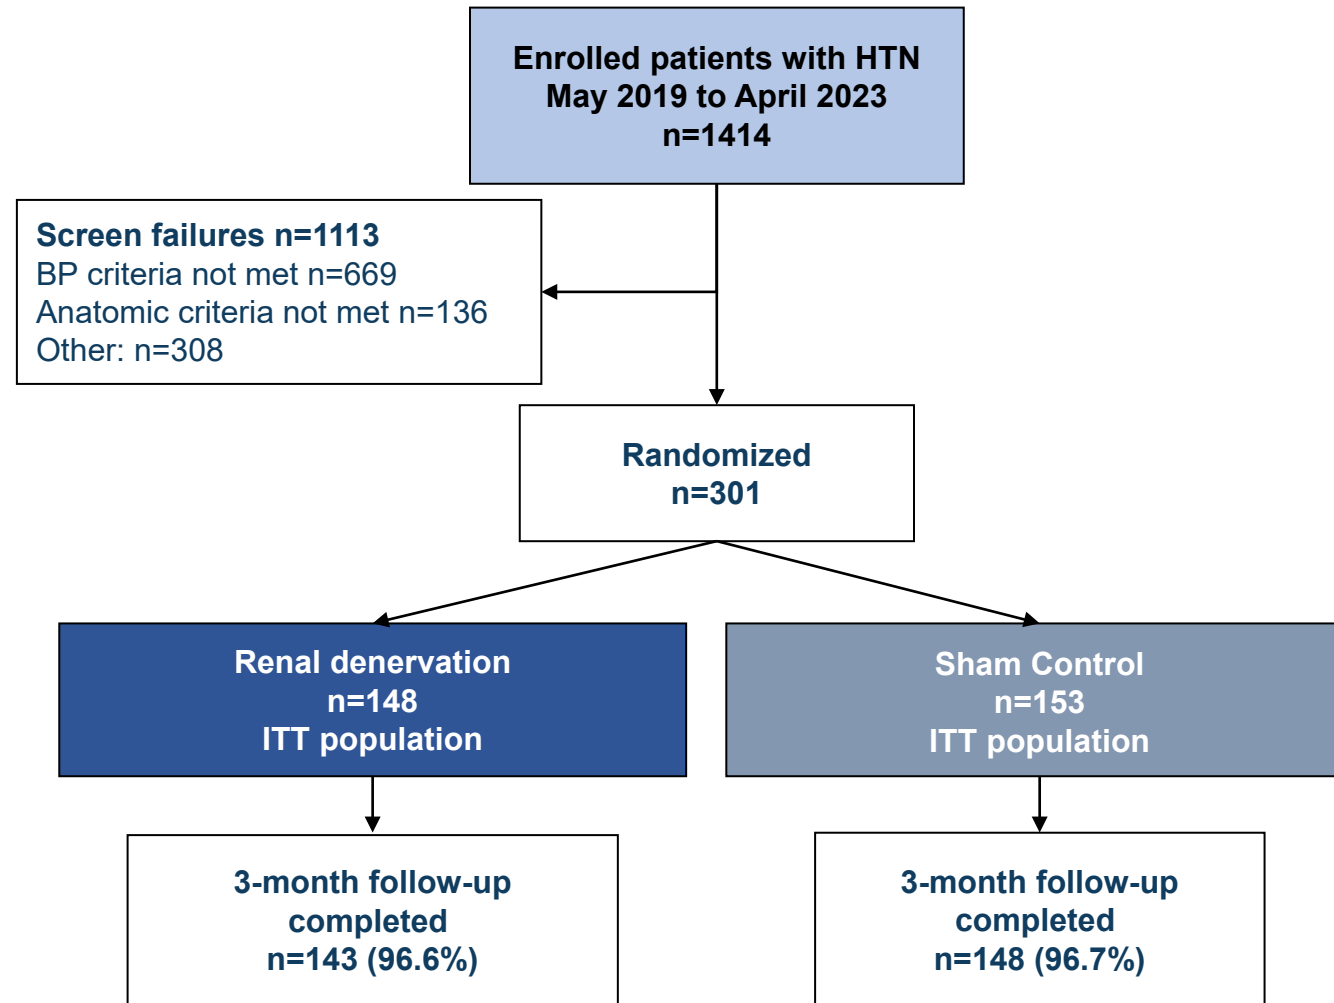

EXCLUSION CRITERIA

- Secondary cause of hypertension
- Type 1 or uncontrolled type 2 DM
- eGFR ≤ 45 mL/min/1.73 m² (per CKD-EPI)
- History of MI, unstable angina pectoris, or stroke/TIA in prior 6 months
- Heart failure (NYHA III or IV) or EF $\leq 30\%$
- Chronic AF

*Diuretic therapy required unless documented intolerance

TARGET BP I

Patient Flow Chart

TARGET BP I

Baseline Patient Characteristics

	RDN (N=148)	Sham (N=153)
Age	56.7 ± 10.0	55.6 ± 9.1
Male	113 (76.4%)	111 (72.5%)
Body-mass index (kg/m ²)	32.6 ± 5.3	32.1 ± 5.3
Chronic kidney disease (eGFR <60 mL/min per 1.73m ²)	15 (10.1%)	20 (13.1%)
Type 2 diabetes	30 (20.3%)	40 (26.1%)
History of arrhythmia	14 (9.5%)	11 (7.2%)
History of congestive heart failure	7 (4.7%)	8 (5.2%)
Smoking (current)	14 (9.5%)	20 (13.1%)
Hyperlipidemia	57 (38.5%)	74 (48.4%)

eGFR (mL/min/1.73m ²) Change ± SD (N)				-1.2 ± 9.9 (138)	-0.86 ± 9.0 (146)	0.73
Vessel Safety Patency (<60% stenosis)				99.6% (280 vessels)	—	—

*Hypotension requiring intervention or medication change

TARGET BP I

Limitations

- High rates of medication nonadherence both at baseline and follow-up
 - No significant differences between groups relative to medication increase/decrease or general adherence
 - Inability of current methods to assess changes in medications within same class or timing of last administration
- Potential influence of home BP assessment uncertain
- Findings limited to 3 months follow-up, and whether progressive declines in BP occur over later follow-up uncertain
- No procedural assessment regarding completeness of denervation
- Results observed with this therapy and in this specific population may not be generalizable to alternative interventional therapies for hypertension and more varied clinical populations

TARGET BP I

Conclusions

- In this sham-controlled, randomized trial inclusive of patients with both uncontrolled and treatment resistant HTN, alcohol-mediated RDN met its primary endpoint, with a modest but significant decrease in 24-hr ambulatory SBP at 3-month follow-up
 - Results consistent across both day/night ABPM and prespecified subgroups
- No significant between group differences were observed relative to office blood pressure assessments
- RDN results observed in context of large BP reductions in sham control cohort
 - Strikingly high rates of partial and complete nonadherence
- Safety of alcohol-mediated RDN associated with favorable procedural performance and intermediate-term safety
- Ongoing, dedicated late-term follow-up will be important to inform the effectiveness as a treatment for uncontrolled HTN
