## ***Guideline Driven Care in Cardio-Oncology: ESC Position Paper***

Daniel J Lenihan, MD  
Professor, Division of Cardiovascular Medicine  
Director, Clinical Research  
Vanderbilt University

# Presenter Disclosure Information

## Advancing Cardiovascular Care of the Oncology Patient

### Washington DC 2.17-18.2017

- I **will not** discuss off label use or investigational use in my presentation.
- I **have** financial relationships to disclose:
  - Research support from: Takeda, Inc.
  - Consultant (modest): Roche, Amgen, Prothena, BMS

## 2016 ESC Position Paper on cancer treatments and cardiovascular toxicity developed under the auspices of the ESC Committee for Practice Guidelines

**The Task Force for cancer treatments and cardiovascular toxicity of the European Society of Cardiology (ESC)**

**Authors/Task Force Members:** Jose Luis Zamorano\* (Chairperson) (Spain), Patrizio Lancellotti\* (Co-Chairperson) (Belgium), Daniel Rodriguez Muñoz (Spain), Victor Aboyans (France), Riccardo Asteggiano (Italy), Maurizio Galderisi (Italy), Gilbert Habib (France), Daniel J. Lenihan<sup>1</sup> (USA), Gregory Y. H. Lip (UK), Alexander R. Lyon (UK), Teresa Lopez Fernandez (Spain), Dania Mohty (France), Massimo F. Piepoli (Italy), Juan Tamargo (Spain), Adam Torbicki (Poland), and Thomas M. Suter (Switzerland)

**ESC Committee for Practice Guidelines (CPG):** Jose Luis Zamorano (Chairperson) (Spain), Victor Aboyans (France), Stephan Achenbach (Germany), Stefan Agewall (Norway), Lina Badimon (Spain), Gonzalo Barón-Esquivias (Spain), Helmut Baumgartner (Germany), Jeroen J. Bax (The Netherlands), Héctor Bueno (Spain), Scipione Carerj (Italy), Veronica Dean (France), Çetin Erol (Turkey), Donna Fitzsimons (UK), Oliver Gaemperli (Switzerland), Paulus Kirchhof (UK/Germany), Philippe Kolh (Belgium), Patrizio Lancellotti (Belgium), Gregory Y. H. Lip (UK), Petros Nihoyannopoulos (UK), Massimo F. Piepoli (Italy), Piotr Ponikowski (Poland), Marco Roffi (Switzerland), Adam Torbicki (Poland), António Vaz Carneiro (Portugal), and Stephan Windecker (Switzerland)

**Document Reviewers:** Stephan Achenbach (CPG Review Coordinator) (Germany), Giorgio Minotti (CPG Review Coordinator) (Italy), Stefan Agewall (Norway), Lina Badimon (Spain), Héctor Bueno (Spain), Daniela Cardinale (Italy), Scipione Carerj (Italy), Giuseppe Curigliano (Italy), Evandro de Azambuja (Belgium), Susan Dent (Canada), Cetin Erol (Turkey), Michael S. Ewer (USA), Dimitrios Farmakis (Greece), Rainer Fietkau (Germany), Donna Fitzsimons (UK), Oliver Gaemperli (Switzerland), Paulus Kirchhof (Germany/UK), Philippe Kohl (Belgium), Paul McGale (UK), Piotr Ponikowski (Poland), Juergen Ringwald (Germany), Marco Roffi (Switzerland),

<sup>1</sup> Representing the International CardiOncology Society (ICOS)

Pocket Guidelines  
and smartphone  
app also available!

The ESC document attempts to summarize a large and diverse spectrum of clinical experience, limited clinical research, and historical reports on the topic.

The document is organized according to these 9 conditions and generally describes **CV complications of cancer therapy, strategies for prevention and attenuation of CV complications, long-term surveillance for cancer survivors,** and suggests **future directions.**

- myocardial dysfunction and heart failure (HF);
- coronary artery disease (CAD);
- valvular disease;
- arrhythmias, especially those induced by QT-prolonging drugs;
- arterial hypertension;
- thromboembolic disease;
- peripheral vascular disease and stroke;
- pulmonary hypertension and
- pericardial complications.

***Key Phrases/Words:***

Complexity

Optimal CV care

Interactions between disciplines

Define a curriculum

Engagement in the development of new therapies

Survivorship

Appropriate evaluation of CV events

**Table 1** Incidence of left ventricular dysfunction associated with chemotherapy drugs<sup>10–21</sup>

Chemotherapy agents	Incidence (%)
<b>Anthracyclines (dose dependent)</b>	
Doxorubicin (Adriamycin)	
400 mg/m <sup>2</sup>	3–5
550 mg/m <sup>2</sup>	7–26
700 mg/m <sup>2</sup>	18–48
Idarubicin (>90 mg/m <sup>2</sup> )	5–18
Epirubicin (>900 mg/m <sup>2</sup> )	0.9–11.4
Mitoxanthone >120 mg/m <sup>2</sup>	2.6
Liposomal anthracyclines (>900 mg/m <sup>2</sup> )	2
<b>Alkylating agents</b>	
Cyclophosphamide	7–28
Ifosfamide	
<10 g/m <sup>2</sup>	0.5
12.5–16 g/m <sup>2</sup>	17
<b>Antimetabolites</b>	
Clofarabine	27
<b>Antimicrotubule agents</b>	
Docetaxel	2.3–13
Paclitaxel	<1
<b>Monoclonal antibodies</b>	
Trastuzumab	1.7–20.1 <sup>21a</sup>
Bevacizumab	1.6–4 <sup>14b</sup>
Pertuzumab	0.7–1.2
<b>Small molecule tyrosine kinase inhibitors</b>	
Sunitinib	2.7–19
Pazopanib	7–11
Sorafenib	4–8
Dasatinib	2–4
Imatinib mesylate	0.2–2.7
Lapatinib	0.2–1.5
Nilotinib	1
<b>Proteasome inhibitors</b>	
Carfilzomib	11–25
Bortezomib	2–5
<b>Miscellaneous</b>	
Everolimus	<1
Temsirolimus	<1

**Table 2** Factors associated with risk of cardiotoxicity following treatment with anthracyclines<sup>a</sup>

Risk factors
<ul style="list-style-type: none"><li>• Cumulative dose</li><li>• Female sex</li><li>• Age<ul style="list-style-type: none"><li>- &gt;65 years old</li><li>- Paediatric population (&lt;18 years)</li></ul></li><li>• Renal failure</li><li>• Concomitant or previous radiation therapy involving the heart</li><li>• Concomitant chemotherapy<ul style="list-style-type: none"><li>- alkylating or antimicrotubule agents</li><li>- Immuno- and targeted therapies</li></ul></li><li>• Pre-existing conditions<ul style="list-style-type: none"><li>- Cardiac diseases associating increased wall stress</li><li>- Arterial hypertension</li><li>- Genetic factors</li></ul></li></ul>

<sup>a</sup>Anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin) or anthracenedione (mitoxantrone).

**Table 3** Factors associated with risk of cardiotoxicity following anti-HER2 compounds and VEGF inhibitors<sup>70–72</sup>

Agent	Risk factors
<b>Anti-HER2 compounds</b>	
<ul style="list-style-type: none"> <li>- Antibodies <ul style="list-style-type: none"> <li>- Trastuzumab</li> <li>- Pertuzumab</li> <li>- T-DMI</li> </ul> </li> <li>- Tyrosine kinase Inhibitor <ul style="list-style-type: none"> <li>- Lapatinib</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Previous or concomitant anthracycline treatment (<i>short time between anthracycline and anti-HER2 treatment</i>)</li> <li>• Age (&gt;65 years)</li> <li>• High BMI &gt;30 kg/mg<sup>2</sup></li> <li>• Previous LV dysfunction</li> <li>• Arterial hypertension</li> <li>• Previous radiation therapy</li> </ul>
<b>VEGF Inhibitors</b>	
<ul style="list-style-type: none"> <li>- Antibodies <ul style="list-style-type: none"> <li>- Bevacizumab</li> <li>- Ramucirumab</li> </ul> </li> <li>- Tyrosine kinase Inhibitors <ul style="list-style-type: none"> <li>- Sunitinib</li> <li>- Pazopanib</li> <li>- Axitinib</li> <li>- Neratinib</li> <li>- Afatinib</li> <li>- Sorafenib</li> <li>- Dasatinib</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Pre-existing HF, significant CAD or left side VHD (e.g. mitral regurgitation), chronic ischaemic cardiomyopathy</li> <li>• Previous anthracycline</li> <li>• Arterial hypertension</li> <li>• Pre-existing cardiac disease</li> </ul>

BMI = body mass index; CAD = coronary artery disease; HER2 = human epidermal growth factor receptor 2; HF = heart failure; MI = myocardial infarction; VEGF = vascular endothelial growth factor; VHD = valvular heart disease.

**Table 4** Baseline risk factors for cardiotoxicity

Current myocardial disease	Demographic and other CV risk factors
<ul style="list-style-type: none"> <li>• Heart failure (with either preserved or reduced ejection fraction)</li> <li>• Asymptomatic LV dysfunction (LVEF &lt;50% or high natriuretic peptide*)</li> <li>• Evidence of CAD (previous myocardial infarction, angina, PCI or CABG, myocardial ischaemia)</li> <li>• Moderate and severe VHD with LVH or LV impairment</li> <li>• Hypertensive heart disease with LV hypertrophy</li> <li>• Hypertrophic cardiomyopathy</li> <li>• Dilated cardiomyopathy</li> <li>• Restrictive cardiomyopathy</li> <li>• Cardiac sarcoidosis with myocardial involvement</li> <li>• Significant cardiac arrhythmias (e.g. AF, ventricular tachyarrhythmias)</li> </ul>	<ul style="list-style-type: none"> <li>• Age (paediatric population &lt;18 years; &gt;50 years for trastuzumab; &gt;65 years for anthracyclines)</li> <li>• Family history of premature CV disease (&lt;50 years)</li> <li>• Arterial hypertension</li> <li>• Diabetes mellitus</li> <li>• Hypercholesterolaemia</li> </ul>
Previous cardiotoxic cancer treatment	Lifestyle risk factors
<ul style="list-style-type: none"> <li>• Prior anthracycline use</li> <li>• Prior radiotherapy to chest or mediastinum</li> </ul>	<ul style="list-style-type: none"> <li>• Smoking</li> <li>• High alcohol intake</li> <li>• Obesity</li> <li>• Sedentary habit</li> </ul>

AF = atrial fibrillation; CABG = coronary artery bypass graft; CAD = coronary artery disease; CV = cardiovascular; LV = left ventricular; LVEF = left ventricular ejection fraction; LVH = left ventricular hypertrophy; VHD = valvular heart disease.

\*B-type natriuretic peptide >100pg/ml or N-terminal pro-B-type natriuretic peptide >400pg/ml with no alternative cause.

**Table 6** Proposed diagnostic tools for the detection of cardiotoxicity

Technique	Currently available diagnostic criteria	Advantages	Major limitations
<b>Echocardiography:</b> - 3D-based LVEF - 2D Simpson's LVEF - GLS	<ul style="list-style-type: none"> <li>• LVEF: &gt;10 percentage points decrease to a value below the LLN suggests cardiotoxicity.</li> <li>• GLS: &gt;15% relative percentage reduction from baseline may suggest risk of cardiotoxicity.</li> </ul>	<ul style="list-style-type: none"> <li>• Wide availability.</li> <li>• Lack of radiation.</li> <li>• Assessment of haemodynamics and other cardiac structures.</li> </ul>	<ul style="list-style-type: none"> <li>• Inter-observer variability.</li> <li>• Image quality.</li> <li>• GLS: Inter-vendor variability, technical requirements.</li> </ul>
<b>Nuclear cardiac imaging (MUGA)</b>	<ul style="list-style-type: none"> <li>• &gt;10 percentage points decrease in LVEF with a value &lt;50% identifies patients with cardiotoxicity.</li> </ul>	<ul style="list-style-type: none"> <li>• Reproducibility.</li> </ul>	<ul style="list-style-type: none"> <li>• Cumulative radiation exposure.</li> <li>• Limited structural and functional information on other cardiac structures.</li> </ul>
<b>Cardiac magnetic resonance</b>	<ul style="list-style-type: none"> <li>• Typically used if other techniques are non-diagnostic or to confirm the presence of LV dysfunction if LVEF is borderlines.</li> </ul>	<ul style="list-style-type: none"> <li>• Accuracy, reproducibility.</li> <li>• Detection of diffuse myocardial fibrosis using T1/T2 mapping and ECVF evaluation.</li> </ul>	<ul style="list-style-type: none"> <li>• Limited availability.</li> <li>• Patient's adaptation (claustrophobia, breath hold, long acquisition times).</li> </ul>
<b>Cardiac biomarkers:</b> - Troponin I - High-sensitivity Troponin I - BNP - NT-proBNP	<ul style="list-style-type: none"> <li>• A rise identifies patients receiving anthracyclines who may benefit from ACE-Is.</li> <li>• Routine role of BNP and NT-proBNP in surveillance of high-risk patient needs further investigation.</li> </ul>	<ul style="list-style-type: none"> <li>• Accuracy, reproducibility.</li> <li>• Wide availability.</li> <li>• High-sensitivity.</li> </ul>	<ul style="list-style-type: none"> <li>• Insufficient evidence to establish the significance of subtle rises.</li> <li>• Variations with different assays.</li> <li>• Role for routine surveillance not clearly established.</li> </ul>

ACE-Is = angiotensin converting enzyme inhibitors; BNP = B-type natriuretic peptide; ECVF = extracellular volume fraction; GLS = global longitudinal strain; LV = left ventricular; LLN = lower limit of normality; LVEF = left ventricular ejection fraction; MUGA = multigated radionuclide angiography; NT-proBNP = N-terminal fragment B-type natriuretic peptide.

### 2.1.3 Key points

- Cancer patients treated with potentially cardiotoxic therapy are at high risk of developing HF and should therefore receive medical care aimed at obtaining strict control of cardiovascular risk factors.
- LVEF should be determined before and periodically during treatment for early detection of cardiac dysfunction in patients receiving potentially cardiotoxic chemotherapy, with a method that provides sufficient image quality and, preferably, using the same method during follow-up.
- This group has decided to consider the lower limit of normal of LVEF in echocardiography as 50%, in line with the definition of cardiotoxicity commonly used in registries and trials in patients with cancer.
- A patient with a significant decrease in LVEF (e.g. a decrease  $>10\%$ ), to a value that does not drop below the lower limit of normal, should undergo repeated assessment of LVEF shortly after and during the duration of cancer treatment.
- If LVEF decreases  $>10\%$  to a value below the lower limit of normal (considered as an LVEF  $<50\%$ ), ACE inhibitors (or ARBs) in combination with beta-blockers are recommended to prevent further LV dysfunction or the development of symptomatic HF, unless contraindicated, as these patients are at high risk of developing HF.
- ACE inhibitors (or ARBs) and beta-blockers are recommended in patients with symptomatic HF or asymptomatic cardiac dysfunction unless contraindicated.

**Table 7** Pathophysiological mechanisms of coronary artery disease in cancer treatment<sup>7,60,81,99,117–123</sup>

Agent	Pathophysiological mechanism	Risk of coronary artery disease and acute coronary syndrome
Fluoropyrimidines (5-FU, capecitabine, gemcitabine)	<ul style="list-style-type: none"> <li>Endothelial injury</li> <li>Vasospasm</li> </ul>	<ul style="list-style-type: none"> <li>Up to 18% manifest myocardial ischaemia</li> <li>Up to 7–10% silent myocardial ischaemia</li> </ul>
Platinum compounds (cisplatin)	<ul style="list-style-type: none"> <li>Procoagulant status</li> <li>Arterial thrombosis</li> </ul>	<ul style="list-style-type: none"> <li>20-year absolute risk of up to 8% after testicular cancer</li> <li>2% risk of arterial thrombosis</li> </ul>
VEGF inhibitors (bevacizumab, sorafenib, sunitinib)	<ul style="list-style-type: none"> <li>Procoagulant status</li> <li>Arterial thrombosis</li> <li>Endothelial injury</li> </ul>	<ul style="list-style-type: none"> <li>Risk of arterial thrombosis: bevacizumab 3.8%, sorafenib 1.7%, sunitinib 1.4%</li> </ul>
Radiotherapy	<ul style="list-style-type: none"> <li>Endothelial injury</li> <li>Plaque rupture</li> <li>Thrombosis</li> </ul>	<ul style="list-style-type: none"> <li>2–7-fold increased relative risk of myocardial infarction</li> <li>Cumulative 30-year coronary events incidence of 10% in Hodgkin lymphoma survivors</li> <li>Risk proportional to irradiation dose</li> </ul>

5-FU = 5-fluorouracil; VEGF = vascular endothelial growth factor.

**Table 8** Cancer drug agents associated with cardiac arrhythmias

Type of arrhythmia	Causative drug
Bradycardia	Arsenic trioxide, bortezomib, capecitabine, cisplatin, cyclophosphamide, doxorubicin, epirubicin, 5-FU, ifosfamide, IL-2, methotrexate, mitoxantrone, paclitaxel, rituximab, thalidomide.
Sinus tachycardia	Anthracyclines, carmustine.
Atrioventricular block	Anthracyclines, arsenic trioxide, bortezomib, cyclophosphamide, 5-FU, mitoxantrone, rituximab, taxanes, thalidomide.
Conduction disturbances	Anthracyclines, cisplatin, 5-FU, imatinib, taxanes.
Atrial fibrillation	Alkylating agents (cisplatin, cyclophosphamide, ifosfamide, melphalan), anthracyclines, antimetabolites (capecitabine, 5-FU, gemcitabine), IL-2, interferons, rituximab, romidepsin, small molecule TKIs (ponatinib, sorafenib, sunitinib, ibrutinib), topoisomerase II inhibitors (amsacrine, etoposide), taxanes, vinca alkaloids.
Supraventricular tachycardias	Alkylating agents (cisplatin, cyclophosphamide, ifosfamide, melphalan), amsacrine, anthracyclines, antimetabolites (capecitabine, 5-FU, methotrexate), bortezomib, doxorubicin, IL-2, interferons, paclitaxel, ponatinib, romidepsin.
Ventricular tachycardia/fibrillation	Alkylating agents (cisplatin, cyclophosphamide, ifosfamide), amsacrine, antimetabolites (capecitabine, 5-FU, gemcitabine), arsenic trioxide, doxorubicin, interferons, IL-2, methotrexate, paclitaxel, proteasome inhibitors (bortezomib, carfilzomib), rituximab, romidepsin.
Sudden cardiac death	Anthracyclines (reported as very rare), arsenic trioxide (secondary to torsade de pointes), 5-FU (probably related to ischaemia and coronary spasm), interferons, nilotinib, romidepsin.

5-FU = 5-fluorouracil; IL-2 = interleukin 2; TKI = tyrosine kinase inhibitor.

**Table 10** Risk factors for QT prolongation in cancer patients

Risk factors for QT prolongation	
Correctable	Non-correctable
<b>Electrolyte imbalance</b> <ul style="list-style-type: none"> <li>Nausea and emesis</li> <li>Diarrhoea</li> <li>Treatment with loop diuretics</li> <li>Hypokalaemia (<math>\leq 3.5</math> mEq/L)</li> <li>Hypomagnesaemia (<math>\leq 1.6</math> mg/dL)</li> <li>Hypocalcaemia (<math>\leq 8.5</math> mg/dL)</li> </ul>	<ul style="list-style-type: none"> <li>Family history of sudden death (occult congenital LQTS or genetic polymorphisms)</li> <li>Personal history of syncope</li> <li>Baseline QTc interval prolongation</li> <li>Female gender</li> <li>Advanced age</li> <li>Heart disease</li> <li>Myocardial infarction</li> <li>Impaired renal function</li> <li>Impaired hepatic drug metabolism</li> </ul>
<b>Hypothyroidism</b>	
<b>Concurrent use of QT-prolonging drugs</b> <ul style="list-style-type: none"> <li>Antiarrhythmic</li> <li>Anti-infective</li> <li>Antibiotic</li> <li>Antifungal</li> <li>Psychotropic</li> <li>Antidepressant</li> <li>Antipsychotic</li> <li>Antiemetic</li> <li>Antihistamine</li> </ul>	

LQTS = long QT syndrome.

**Table 11** Clinical factors associated with increased risk of cancer-associated venous thromboembolism (modified from Khorana et al.<sup>182</sup>)

**Cancer-related factors**

- Primary site of cancer (mostly pancreas, brain, stomach, kidney, lung, lymphoma, myeloma)
- Histology (specially adenocarcinoma)
- Advanced stage (metastatic)
- Initial period after cancer diagnosis

**Patient-related factors**

- Demographics: older age, female sex, African ethnicity
- Comorbidities (infection, chronic kidney disease, pulmonary disease, atherothrombotic disease, obesity)
- History of venous thromboembolism, inherited thrombophilia
- Low performance status

**Treatment-related factors**

- Major surgery
- Hospitalization
- Chemotherapy and anti-angiogenic agents
- Hormonal therapy
- Transfusions
- Central venous catheters

**Supplementary Table** Most recent reviews and meta-analyses on the incidence of hypertension with major VEGF inhibitor treatment

Drug	Number of studies included	Number of patients	Incidence of all grades of HTN, %	Incidence of stage 3-4 HTN, %
Bevacizumab <sup>165</sup>	20	6754	23.6	7.9
Sunitinib <sup>167</sup>	13	4999	21.6	6.8
Sorafenib <sup>168</sup>	13	2492	15.3	4.4
Axitinib <sup>169</sup>	10	1908	40.1	13.1
Vandetanib <sup>170</sup>	11	3154	24.2	6.8
Regorafenib <sup>171</sup>	5	750	44.4	12.5

HTN = hypertension; VEGF = vascular endothelial growth factor.

## ESC Position Paper on Cancer treatments and Cardiotoxicity

- A very ambitious task that was completed in a relatively short time
- The pocket guidelines and smart phone app are unique advantages
- The content was an excellent summary of a broad constellation of topics
- Complete guidelines will be done in 1-2 years
- A call for concerted research is a must!

**Save the Date**
