Burden of Cardiometabolic Disease in American Indians

- Cardiovascular diseases (CVD) & diabetes mellitus are leading causes of morbidity & mortality among American Indians (AIs)
- AIs have an exaggerated prevalence of obesity and diabetes mellitus compared to the general population

Burden of Cardiometabolic Disease in American Indians

- Als have premature CVD mortality and morbidity
 - CVD mortality rate 20% greater among Als than other US races
 - Als die of CVD at younger ages
 - 36% will die before age 65 compared to 14.7% of non-Hispanic whites

Am J Public Health. 2014;104 Suppl 3:S359-367
MMWR Morb Mortal Wkly Rep. 2004;53:121-125

Burden of Cardiometabolic Disease in American Indians

- Prevalence of diabetes mellitus among Strong Heart Study participants aged 45-74 years in 1989 was 45% (compared to 7.7% in gen. pop)
- High burden of diabetes mellitus in AI communities may be at least partly attributable to changes in lifestyle (as well as other social factors)

Social Drivers of Health

- Social drivers of health and psychological health factors are important CVD risk factors in AIs

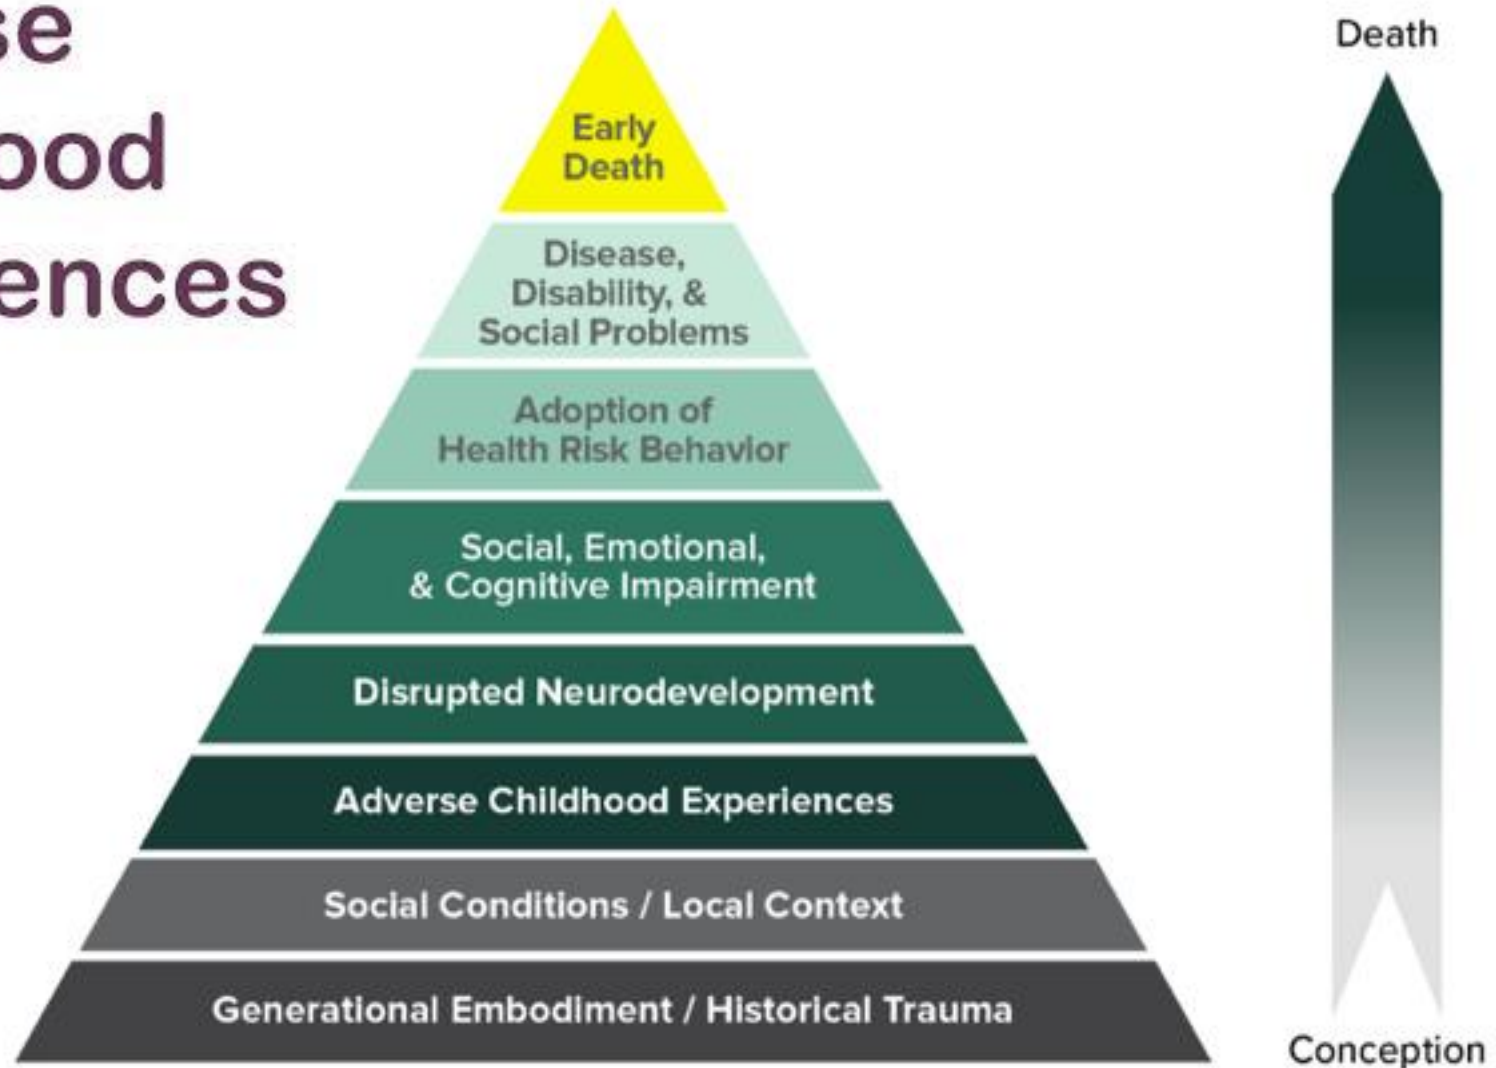

Social Drivers of Health

- Systemic racism
- Historical trauma
- Neighborhood safety, food insecurity, lack of access to preventative care, and financial and economic depression
- Anxiety, depression, PTSD, substance abuse, intimate partner violence, sociocultural roles

Heart Care Worldwide

Strong Heart Study

- Largest & longest on-going multi-tribal study of CVD in AIs
- 12 participating tribes from AZ, OK, ND, SD

Strong Heart Study Objectives

- Quantify prevalent CVD and its risk factors
- Quantify incident CVD events
- Evaluate preclinical CVD

Strong Heart Study Design

- Two AI cohorts:
 - Original cohort (Strong Heart Study)
 - 4,549 participants
 - 45-74 years
 - 59% female
 - Began in 1988

Strong Heart Study Design

- Two AI cohorts:
 - Family cohort (Strong Heart Family Study)
 - 3,665 participants
 - 14-94 years
 - 60% female
 - Began in 1998
 - Extended SHS by including family members and added the identification of genetic risk factors for CVD.

AMERICAN
COLLEGE of
CARDIOLOGY

Advancing Heart Care Worldwide

SHS is community-based research

- 30+ year partnership
- Tribal communities guide study goals
- Tribes and participants involved in all aspects of the study (design, data collection, dissemination) and are considered co-PIs

Strong Heart Study Key Findings

- Rates of coronary heart disease higher than other US populations
- Very high rates of insulin resistance and diabetes

are associated with cardiac alterations independently of major confounders in a population-based sample of adolescents and young adults.

CONCLUSIONS—In a population of adolescents and young adults, DM is independently associated with early unfavorable cardiovascular phenotype characterized by increased left ventricular mass, concentric geometry, and early preclinical systolic and diastolic dysfunction; early cardiovascular alterations are also present in participants with prediabetes.

Addressing CVD in AIs through multi-level interventions

- Intergenerational trauma in AI communities increases ACEs and leads to health inequities
- Mistrust in US government and research community hinders care delivery
- Requires effort to regain trust to identify strength-based health interventions

Table. Policy-Level Framework and Interventions to Optimize Maternal CVH in American Indian/Alaska Native Individuals

Areas of intervention	Suggested solutions	Gaps and challenges
Integrated care delivery models	<p>Provide appropriate screening and transfer of individuals with high-risk pregnancies to higher levels of care with multidisciplinary team-based care in preventive cardiology, maternal-fetal medicine, cardio-obstetrics, and psychiatry.</p> <p>Provide contraceptive care and shared decision making around termination.</p> <p>Initiate first-line management of complications and adherence to quality bundles and initiatives to reduce death and morbidity.</p>	<p>Data collection, aggregation, and transfer of maternal health outcomes</p> <p>Lack of AI/AN disaggregated data in PMSS</p> <p>Rural landscape, lack of access to housing, particularly in tribal settings, and staffing shortages</p>
Organization of care	<p>Develop an available, accessible, affordable, and competent workforce that integrates community voices and AI/AN traditions into culturally sensitive care. Ensure shared decision making that includes AI/AN and tribal representation. Incorporate midwives, social workers, mental health counselors, doulas, AI/AN traditional healers, knowledge bearers, birth workers and peers, community health workers, and physician extenders into care.</p> <p>Expand digital and telehealth in resource-limited areas as a supplement to existing care resources but not as a substitute for care and to provide sufficient resources to these areas.</p>	<p>Increase the financial resources currently being deployed, and strategically increase investment in tribes, IHS facilities, and culturally safe community-based programs by earmarking funds for this purpose.</p> <p>Telemedicine may not reach AI/AN community members with severely limited means.</p> <p>Reimbursement structures are not inclusive of necessary collaborators such as AI/AN traditional healers, birth workers, and midwives.</p>
Innovative practice categories	<p>Improve health education and health promotion in Life's Essential 8 metrics from childhood throughout childbearing age.</p> <p>Improve preconception, antenatal, and postpartum CVH measures.</p>	<p>High burden of cardiovascular comorbidities and low preventive care services</p>
Values and philosophy	<p>Build trust with respect, communication, and community knowledge, and understand the needs of reproductive-aged individuals.</p> <p>Deliver care tailored toward creating understanding historical perspective, childhood trauma, and circumstances unique to maternal needs.</p>	<p>Assess childhood trauma in individuals and population and develop strategies to mitigate it.</p>

AI/AN indicates American Indian/Alaska Native; CVH, cardiovascular health; IHS, Indian Health Service; and PMSS, Pregnancy Mortality Surveillance System.

Cooking for Health: a healthy food budgeting, purchasing, and cooking skills randomized controlled trial to improve diet among American Indians with type 2 diabetes

Caitlin N. Hawley¹, Corrine M. Huber², Lyle G. Best², Barbara V. Howard³, Jason Umans², Shirley A. A. Beresford¹, Barbara McKnight⁴, Adette Hager⁵, Marcia O'Leary², Anne N. Thomsdike¹, Ineda J. Ordaz⁶, Meagan C. Brown² and Amanda M. Fretts^{2*}

Abstract
Background: The prevalence of poor diet quality and type 2 diabetes are exceedingly high in many rural American Indian (AI) communities. Because of limited resources and infrastructure in some communities, implementation of interventions to promote a healthy diet is challenging—which may exacerbate health disparities by region (urban/rural) and ethnicity (AI/other populations). It is critical to adapt existing evidence-based healthy food budgeting, purchasing, and cooking programs to be relevant to underserved populations with a high burden of diabetes and related complications. The Cooking for Health Study will work in partnership with an AI community in South Dakota to develop a culturally-adapted 12-month distance-learning-based healthy food budgeting, purchasing, and cooking intervention to improve diet among AI adults with type 2 diabetes.
Methods: The study will enroll 165 AIs with physician-diagnosed type 2 diabetes who reside on the reservation. Participants will be randomized to an intervention or control arm. The intervention arm will receive a 12-month distance-learning curriculum adapted from Cooking Matters® that focuses on healthy food budgeting, purchasing, and cooking skills. In-person assessments at baseline, month 6 and month 12 will include completion of the Nutrition Assessment Shared Resources Food Frequency Questionnaire and a survey to assess frequency of healthy and unhealthy food purchases. Primary outcomes of interest are: (1) change in self-reported intake of sugar-sweetened beverages (SSB); and (2) change in the frequency of healthy and unhealthy food purchases. Secondary outcomes include: (1) change in self-reported food budgeting skills; (2) change in self-reported cooking skills; and (3) a mixed-methods process evaluation to assess intervention reach, fidelity, satisfaction, and dose delivered/received.

Abstract

Objective: Perceptions of social-contextual food environments and associated factors that influence food purchases are understudied in American Indian (AI) communities. The purpose of the present study was to: (i) understand the perceived local food environment; (ii) investigate social-contextual factors that influence family food-purchasing choices; and (iii) identify diet intervention strategies.
Design: This qualitative study consisted of focus groups with primary household shoppers and key-informant interviews with food retailers, local government food

Improving Cardiovascular Health
Among Indigenous Communities:
Effective Solutions and Interventions

Jason Deen MD, FAAP, FAAC¹; Amanda M. Fretts, PhD, MPH²

BACKGROUND

The ACC Health Equity Webinar Companion Guides are a complementary resource for the ACC Health Equity Webinar series. The webinar series, produced by the ACC Diversity and Inclusion Committee, offers clinically relevant, evidence-based findings focused on health care disparities as they pertain to minority racial and ethnic groups and under-represented populations in cardiovascular care. This guide provides the background, highlights, and clinical pearls from the “Improving Cardiovascular Health Among Indigenous Communities: Effective Solutions and Interventions” webinar.
