BACKGROUND & OBJECTIVE
Data in healthcare is vast and variable in both sources and structures. Though software tools can provide insights that assist in medical and financial decisions, resulting scorecards and dashboards are often specialty-specific. At Atrium Health’s Sanger Heart and Vascular Institute in Charlotte, North Carolina a central “Value Dashboard” was therefore created to display data encompassing all subspecialties to provide the big picture of cardiovascular quality and cost.

METHODS
A multi-disciplinary team, formed by MD Vice Chair of Quality and Clinical Transformation, included specialty physician champions, administrative leaders, and teammates with expertise in quality/care transformation, cost/clinical analytics, and clinical registries. Over multiple months this team created and revised an initial concept of the “Value Dashboard” to display metrics from various sources such as registries, variable costs, quality, clinical compliance tracking, and patient reported outcomes.

RESULTS
The “Value Dashboard” is comprised of 10 subspecialty pages and an institute-wide page that contains a high-level summary of each subspecialty page. The institute-wide and subspecialty pages are widely available and evaluated at least monthly at teammate and stakeholder meetings to encourage transparency and to foster ongoing quality improvement efforts.

CONCLUSIONS
Having a central dashboard allows for efficient performance evaluation and the identification of paths for optimization. Value Dashboard is continually evolving

- When performance is trending unfavorably for a metric, issues identified are listed, and strategies put into action to address those issues are summarized
- Updates to metric definitions and benchmarks are incorporated frequently

Future State
- Integrating tabs specific to additional service line initiatives and public reported performance measures

CLINICAL IMPLICATION
A centralized dashboard of quality, cost and operational data enables cardiovascular clinicians to drive continuous improvement in the value of care.
