COMING TO CONSENSUS IN A NEW ERA: THE ROLE OF NON-STATIN THERAPIES

Introduction: Pamela B. Morris, MD, FACC
2013 Cholesterol Guidelines: Recommendations for Initiating Statin Therapy

Heart healthy lifestyle habits are the foundation of ASCVD prevention (See 2013 AHA/ACC Lifestyle Management Guideline)

- Adults age >21 y and a candidate for statin therapy
  - Yes → Clinical ASCVD
    - Yes → Age ≤75 y
      - High-intensity statin (Moderate-intensity statin if not candidate for high-intensity statin)
    - Yes → Age >75 y OR if not candidate for high-intensity statin
      - Moderate-intensity statin
  - No → Definitions of High- and Moderate-Intensity Statin Therapy (See Table 5)
    - High
      - Daily dose lowers LDL−C by approx. ≥50%
    - Moderate
      - Daily dose lowers LDL−C by approx. 30% to <50%
  - Yes → LDL−C ≥190 mg/dL
    - Yes → High-intensity statin (Moderate-intensity statin if not candidate for high-intensity statin)
    - No → Diabetes
      - Type 1 or 2
      - Age 40-75 y
        - Yes → Estimated 10-y ASCVD risk ≥7.5%*
          - High-intensity statin
        - No → Moderate-intensity statin

2013 Cholesterol Guidelines: Recommendations for Initiating Statin Therapy - 2

Clinical-Patient Discussion
Prior to initiating statin therapy, discuss:
1. Potential for ASCVD risk reduction benefits
2. If decision is unclear, consider primary LDL-C ≥160 mg/dL, family history of premature ASCVD, lifetime ASCVD risk, abnormal CAC score or ABI, or hs-CRP ≥2 mg/L
3. Potential for adverse effects and drug-drug interactions
4. Healthy lifestyle
5. Management of other risk factors
6. Patient preferences

Emphasize adherence to lifestyle
Manage other risk factors
Monitor adherence

No to statin
Yes to statin

Encourage adherence to lifestyle
Initiate statin at appropriate intensity
Manage other risk factors
Monitor adherence (See Fig 5)
‘Clinicians treating high risk patients who have a less than anticipated response to statins, who are unable to tolerate a less than recommended intensity of a statin or who are completely statin intolerant, may consider the addition of non-statin cholesterol lowering therapy...’

‘In this situation, this guideline recommends clinicians preferentially prescribe drugs that have been shown in RCTs to provide ASCVD risk-reduction benefits that outweigh the potential for adverse effects and drug-drug interactions and consider patient preferences.’
2016 Expert Consensus Decision Pathway

Background

• September 2015: 2nd “LDL: Address the Risk Think Tank”
  – Multi-stakeholder quality initiative to improve patient outcomes by driving awareness of gaps in lipid management
  – Expert clinicians, patient advocacy groups, health plans, pharmacy benefit managers, drug manufacturers, EHR vendors, and health systems

  – Identified need for expert consensus guidance regarding incorporation of non-statin therapies into treatment strategies for higher-risk patients
2016 Expert Consensus Decision Pathway

Rationale

• Provide more specific guidance on the adequacy of statin therapy and whether or when to use non-statin therapies if response to statins is deemed inadequate or less than anticipated

• Extend beyond 2013 evidence base to incorporate recent trial data and address current gaps in care for LDL-C lowering to reduce ASCVD risk
  – HPS2-THRIVE (niacin/laropiprant)
  – IMPROVE-IT (ezetimibe+simvastatin)

• Consider use of drugs FDA-approved after publication of 2013 guideline (alirocumab, evolocumab)
EXPERT CONSENSUS DECISION PATHWAY

2016 ACC Expert Consensus Decision Pathway on the Role of Non-Statin Therapies for LDL-Cholesterol Lowering in the Management of Atherosclerotic Cardiovascular Disease Risk

A Report of the American College of Cardiology Task Force on Clinical Expert Consensus Documents

Endorsed by the National Lipid Association

*National Lipid Association Representative.
2016 Expert Consensus Decision Pathway

Questions Addressed

1. In what patient populations should non-statin therapies be considered?

2. In what situations should non-statin therapies be considered?
   - When is the amount of LDL-C lowering less than anticipated, less than desired, or inadequate, and which treatment options should be considered in patients who are truly statin intolerant?

3. If non-statin therapies are to be added, which agents or therapies should be considered and in what order?
• Thresholds for consideration of net benefit
  – Maximally-tolerated statin therapy
  – **Percent** LDL-C reduction: Achieve ≥50% LDL-C reduction on high-intensity statin, or ≥30% to <50% reduction for moderate-intensity statin
  – May consider **absolute** LDL-C levels (or non-HDL-C in patients with DM) as factors
    • WG emphasizes that these are not firm triggers (not “goals”) for adding medication but factors that may be considered within the broader context of an individual patient’s clinical situation
2016 Expert Consensus Decision Pathway
Non-Statin Therapies Considered

- Ezetimibe
- Bile-acid sequestrants (BAS)
- PCSK9 inhibitors
  - Alirocumab, evolocumab
- Mipomersen
- Lomitapide

For selected pts with HoFH under care of a lipid specialist

- LDL apheresis

- Niacin NOT routinely recommended
2016 Expert Consensus Decision Pathway
Patient Populations Addressed

PATIENT POPULATIONS ADDRESSED: 4 STATIN BENEFIT GROUPS

**Adults ≥21 years of age with clinical ASCVD, on statin for secondary prevention**

**Adults ≥21 years of age with LDL-C ≥190 mg/dL (not due to secondary modifiable causes), on statin for primary prevention**

**Adults aged 40-75 years without ASCVD but with diabetes and LDL-C 70-189 mg/dL, on statin for primary prevention**

**Adults aged 40-75 years without clinical ASCVD or diabetes, with LDL-C 70-189 mg/dL and an estimated 10-year risk for ASCVD of ≥7.5%, on statin for primary prevention**
**Decision Pathway Algorithms**

**General**

- **Patient group addressed**
- **Threshold for considering additional action**
- **Clinical actions to consider to achieve desired response**
- **Factors to consider in clinician-patient discussion re: use of non-statin therapies**
- **Non-statin therapies to consider in order**
- **Continued monitoring for adherence and response**
2016 Expert Consensus Decision Pathway
Summary: Patient Populations Addressed

PATIENT POPULATIONS ADDRESSED: 4 STATIN BENEFIT GROUPS

- **Adults ≥21 years of age with clinical ASCVD, on statin for secondary prevention**
  - Ezetimibe first
  - PCSK9i may then be added or replace ezetimibe
  - LDL-C >190 mg/dl either agent first

- **Adults ≥21 years of age with LDL-C ≥190 mg/dL (not due to secondary modifiable causes), on statin for primary prevention**
  - Ezetimibe OR PCSK9i may be considered first

- **Adults aged 40-75 years without ASCVD but with diabetes and LDL-C 70-189 mg/dL, on statin for primary prevention**
  - Ezetimibe may be considered
  - PCSK9i not recommended in primary prevention patients with DM

- **Adults aged 40-75 years without clinical ASCVD or diabetes, with LDL-C 70-189 mg/dL and an estimated 10-year risk for ASCVD of ≥7.5%, on statin for primary prevention**
  - Ezetimibe may be considered
  - PCSK9i are not recommended

Clinical ASCVD and baseline LDL-C >190 mg/dL
2016 Expert Consensus Decision Pathway
Take-Home Points

• Follow evidence-based 2013 ACC/AHA Cholesterol Guidelines for use of lipid-lowering therapies to reduce ASCVD risk
• Engage in shared decision making to consider potential benefits and harms of non-statin therapies
• Consider specific non-statin therapies only in higher-risk pts who have inadequate response to statin or statin intolerance
• Individualize care for other patient groups
Case Presentations
Case Presentation #1
Case Presentation #1:
ASCVD and LDL-C >190 mg/dl

- A 61 yo female presents with STEMI and undergoes PCI of proximal LAD lesion.
  - Mild hypokinesia of anterior wall, preserved LV ejection fraction
  - Baseline LDL-C is 208 mg/dL (5.4 mmol/L).
  - She is discharged on atorvastatin 80 mg daily.
Case Presentation #1:
ASCVD and LDL-C >190 mg/dl

- Post STEMI/PCI follow-up in 8 weeks
  - Reports adherence to medications and lifestyle recommendations, in cardiac rehabilitation program.
  - Repeat fasting lipid panel shows:
    - Total cholesterol 218 mg/dL (5.6 mmol/L)
    - HDL-C 44 mg/dL (1.14 mmol/L)
    - LDL-C 142 mg/dL (3.67 mmol/L)
    - Triglycerides 160 mg/dL (1.81 mmol/L)
    - LDL-C reduction 32%
ARS: Has this patient achieved anticipated LDL-C lowering with high-intensity statin therapy?

1 - Yes

2 - No
ARS: Has this patient achieved anticipated LDL-C lowering with high-intensity statin therapy?

1 - Yes 56%

2 - No 44%
ARS: Which ONE of the following non-statin therapies would you consider adding as first agent to achieve additional LDL-C lowering?

1 - Colesevelam
2 - Nicotinic acid
3 - Ezetimibe
4 - PCSK9 inhibitor
5 - None
ARS: Which ONE of the following non-statin therapies would you consider adding as first agent to achieve additional LDL-C lowering?

1 - Colesevelam: 16%
2 - Nicotinic acid: 18%
3 - Ezetimibe: 26%
4 - PCSK9 inhibitor: 25%
5 - None: 15%
Case Presentation #1:
ASCVD and LDL-C >190 mg/dL

• Following clinician-patient discussion ezetimibe 10 mg is added.
  – Follow-up lipid panel in 8 weeks demonstrates:
    • Total cholesterol 187 mg/dL (4.84 mmol/L)
    • HDL-C 42 mg/dL (1.09 mmol/L)
    • LDL-C 114 mg/dL (2.95 mmol/L)
    • Non-HDL-C 145 mg/dL
    • Triglycerides 155 mg/dL (1.75 mmol/L)
    • Total LDL-C reduction on combination therapy = 45%
ARS: Has this patient achieved anticipated LDL-C lowering with high-intensity statin therapy?

1 - Yes

2 - No
ARS: Has this patient achieved anticipated LDL-C lowering with high-intensity statin therapy?

1 - Yes  33%

2 - No  67%
ARS: Which ONE of the following non-statin therapies would you consider adding to achieve additional LDL-C lowering?

1 - Colesevelam
2 - Nicotinic acid
3 - Ezetimibe
4 - PCSK9 inhibitor
5 - None
ARS: Which ONE of the following non-statin therapies would you consider adding to achieve additional LDL-C lowering?

1 - Colesevelam 15%
2 - Nicotinic acid 23%
3 - Ezetimibe 31%
4 - PCSK9 inhibitor 13%
5 - None 18%
Discussion

• Has this patient achieved anticipated reduction in atherogenic lipoproteins?

• Is the degree of lowering of atherogenic lipoproteins acceptable?

• Would you consider additional modifications to the patient’s regimen?

• What factors would you consider in the decision to further modify the patients medical regimen?
Clinical ASCVD and baseline LDL-C > 190 mg/dL
Case Presentation #2
Case Presentation #2:
Recurrent ASCVD event on maximally-tolerated statin therapy

• 41 yo male who is an ex-smoker with symptomatic peripheral arterial disease and prior NSTEMI with PCI to LAD and OM1.
  – Baseline fasting lipid panel:
    • Total cholesterol 283 mg/dL (7.32 mmol/L)
    • HDL-C 38 mg/dL (0.98 mmol/L)
    • LDL-C 217 mg/dL (5.61 mmol/L)
    • Triglycerides 142 mg/dL (1.60 mmol/L)
Case Presentation #2: Recurrent ASCVD event on maximally-tolerated statin therapy

- Patient now presents with recurrent NSTEMI/ACS.
- He undergoes PCI to RCA without complications.
- On admission he reports excellent adherence to therapy with rosvuvastatin 40 mg and lifestyle modifications.
  - 41% reduction in LDL-C on high-intensity statin therapy
  - Absolute level LDL-C 128 mg/dL (3.31 mmol/L)
ARS: Has this patient achieved anticipated LDL-lowering with high-intensity statin therapy?

1 - Yes

2 - No
ARS: Has this patient achieved anticipated LDL-C lowering with high-intensity statin therapy?

1 - Yes  46%

2 - No  54%
ARS: Which ONE of the following non-statin therapies would you consider adding as first agent to achieve additional LDL-C lowering?

1 - Colesevelam
2 - Nicotinic acid
3 - Ezetimibe
4 - PCSK9 inhibitor
5 - None
ARS: Which ONE of the following non-statin therapies would you consider adding as first agent to achieve additional LDL-C lowering?

1 - Colesevelam  
2 - Nicotinic acid  
3 - Ezetimibe  
4 - PCSK9 inhibitor  
5 - None
Discussion

• Has this patient achieved anticipated reduction in atherogenic lipoproteins?

• Is the degree of lowering of atherogenic lipoproteins acceptable?

• Would you consider additional modifications to the patient’s regimen?

• What factors would you consider in the decision to further modify the patient’s medical regimen?
Clinical ASCVD with comorbidities
(DM, recent acute ASCVD event, ASCVD event while on statin, baseline LDL-C ≥190 mg/dl, uncontrolled major RFs, elevated Lp(a), CKD)
